# ALASKA POPULATION OVERVIEW

## PREFACE

*Alaska Population Overview* is designed to provide frequently requested population information in one publication. This publication presents the resident population of Alaska under the same concepts and definitions used by the U.S. Bureau of the Census for the 1980 Decennial Census of Alaska. Population fluctuates throughout the year. Because of this fluctuation, the July 1 population presented here represent an average population for the year rather than the population on July first.

This edition of *Alaska Population Overview* is composed of six chapters. The first chapter summarizes some of the key demographic facts from this publication. The next four chapters cover current and historical population estimates for the state, boroughs and census areas, special areas, and places. Chapter six discusses methodologies used in the estimate process.

The estimates produced for this *Alaska Population Overview* are presented in the main body of this report without discussion of the methodology. Methodology is discussed in Chapter six. A description of specialized terms is found in the glossary at the end of this publication. We recommend that the reader read the chapter on the estimating methodology in the Overview and become familiar with the estimation techniques and limitations of the data series.

Population projections for the state appear in the separate publication *Alaska Population Projections*. The first edition was published in the winter of 1986 and the second is scheduled for fall 1990.

In addition, specific information on life expectancy by age, race and sex for Alaska will be found in *Alaska Life Tables for 1977-83*, Demographic Report No. 1, Alaska Department of Labor, Research and Analysis, 1986.

The statistics which appear in this issue of *Alaska Population Overview* supersede figures appearing in earlier issues of this publication, due to changes in methodology and the updating of estimates. Because of these revisions, we recommend that any trend data should be computed from this edition of *Alaska Population Overview* rather than a combination of past editions.

Although estimates in this publication are published in unrounded form for ease of use in other computations, the reader should not assume that any estimates are accurate to the last place. In general, the state estimate is assumed to be accurate to the nearest thousand and borough and census area estimates to the nearest hundred.

Any comments or suggestions regarding the contents or format of this publication are welcome. General requests for demographic information should be addressed to Greg Williams. The telephone number for the Demographics Unit is (907) 465-4500. Questions regarding the 1990 Census should be addressed to the State Data Center at the same number.

Special acknowledgment is given to Debra Andereggen, and John Tomaro of Vital Statistics section and Elfrida Nord of the Nursing section of the Alaska Department of Health and Social Services, Public Health Division; Jo Van Patten of the Alaska Department of Education; Josh McCoy of the U.S. Postal Service and the Alaska Departments of Revenue and Community and Regional Affairs for their aid in providing information used in these estimates.

In addition, we wish to thank the numerous individuals in city and borough governments and small communities who provided information relative to this set of estimates. We also thank personnel departments of the Army, Air Force, Navy, and Coast Guard in Alaska for the statistics they provide each year.

Jim Fowler, Graphic Artist, and Jo Ruby, Phototypesetter Operator, of our Publications Unit also deserve thanks for their help in preparing this publication.

# CHAPTER 1

# OVERVIEW

## ALASKA POPULATION TRENDS

- The Department of Labor estimates that the Alaska population on July 1, 1989, was 534,400. The estimate for July 1, 1988, was 531,000. The population on April 1, 1980, was 401,851.
- The number of households in Alaska in 1988 is estimated to be 177,137.
- The total population of the United States on July 1, 1988, including Armed Forces overseas was 246,329,000. For July 1, 1989, it was 248,762,000.
- During the early 1980s, Alaska was the most rapidly growing state in the United States. Growth peaked in 1983 and the pace of growth has declined since that time. The average annual rate of change between the 1980 census and July 1, 1986 was 4.6%. The average annual rate of change from July 1, 1986 to July 1, 1989 was -1.5%, reflecting the "Boom-Bust" nature of growth during the 1980s.
- By the Alaska Department of Labor estimate, Alaska is now the fiftieth largest "state", counting Washington D.C. Only Wyoming, whose population on July 1, 1989, was estimated to be 475,000, had fewer people than Alaska. Vermont whose population was estimated to be 567,000 in 1988 is the next largest state.
- Between July 1, 1988, and July 1, 1989, 11,035 persons were born in Alaska and 2,080 persons died. The resulting net natural increase was 8,955 persons. In this same period, Alaska lost approximately -5,555 persons through migration. Birth and death rates for Alaska Natives are higher than for Whites.
- The average number of children for White Alaska families in 1988 was 2.1, while the average number of children for Alaska Native families was 3.6.
- Normally, Alaska has the highest level of migration of any state. In almost any year at least 10% of the State population leaves and is replaced. In 1987-88, however, Alaska lost about 16,000 persons through migration.
- The three states who supply and receive the most migrants from Alaska are: Washington, California and Oregon.

- The Alaska Native population of the State in 1988 was about 81,200 or 15% of Alaska's population. While this is a substantial increase from the 64,103 for 1980, the proportion has dropped from 16% due to the rapid in-migration of nonnatives in the early 1980s. Alaska Natives make up 4.8% or all Native Americans.

- Alaska's population, while aging like the rest of the U.S., remains very young. In 1989, the median age of Alaskans was 29.4 years compared to 26.1 years in 1980. During the same period the median age of the U.S. population has increased from 30.0 to 32.6 years.

- In 1989, there were about 49,753 children under five years old in Alaska, 9.3% of the population. The proportion under five years of age for the U.S. was 7.5%.

- The economic downturn has had a major impact on persons 18-34 and children under five years of age.

- In 1989, approximately 110,029 persons, or 20.6% of the Alaska population, were of elementary and secondary school age (5-17). Nationwide, 8.2% of the population was of school age. School age population rose slightly in Alaska in 1988-89.

- In 1989 352,733 persons, or 66.0 % of the population, were in the adult working ages of 18-64. Nationwide, 61.8% of the population was of adult working age.

- In 1989, Alaska's population had nearly 21,885 persons (4.1%) 65 years old or older. The proportion over 65 nationwide was 12.5%. The growth of the older population is relatively unaffected by the growth and decline of Alaska's economy.

- In 1989, 48.2% of Alaska's population, or 257,504 persons, were female compared to .3% female for the United States as a whole. Contrary to the popular press image, there were, on average, only 108 males for every 100 females in the State.

## POPULATION TRENDS FOR ALASKA BOROUGHS AND CENSUS AREAS

- Land area in Alaska consists of 570,833 square miles or 16.3% of the total land area of the United States. Alaska's population in 1989 consisted of 0.21% of the population of the United States.

- In 1988, Alaska had 0.3 persons per square mile. Excluding Anchorage, the remainder of Alaska had 0.54 persons per square mile. The least dense settled part of Alaska is the Yukon-Koyukuk Census Area. This area is larger than California with a density of .06 persons per square mile.

- In 1988, 222,950 persons, or 2.0 % of Alaska's population, lived in the Municipality of Anchorage.

- Alaska grew by 127,800 persons between July 1, 1980 and July 1, 1986, an increase of 30.4% in 6 years. About 87.7% percent of the growth in this period occurred in Anchorage (+54,844), Matanuska-Susitna Borough (+20,058), Fairbanks North Star Borough (+17,293), Kenai Peninsula Borough (+13,944) and Juneau Borough (+5,910). Between July 1, 1986, and July 1, 1988, Alaska's population declined by 9,800 persons. Four boroughs (Anchorage, Matanuska-Susitna, Kenai Peninsula Borough and Juneau Borough) lost a total of 7,356 persons in that year, accounting for 75.0% of the losses.

- The highest birth rates can be found in the heavily Native areas of the state. The lowest birth rates can be found in areas of Southeast Alaska.
- Mortality is currently the highest in heavily Native areas of the state and in Southeast Alaska where the population is older. The lowest death rates can be found the major urban areas and the transient military areas.
- The largest numerical increases of Alaska Natives have occurred in the Anchorage Borough, Bethel Census Area, Nome Census Area, Fairbanks North Star Borough, Dillingham Census Area, Northwest Arctic Borough, Wade Hampton Census Area and North Slope Borough.
- More Alaska Natives now live in Anchorage (13,607) than in any other Borough or Census Area.
- Wade Hampton Census Area has the highest percentage of Alaska Natives (88.7%), while Matanuska-Susitna Borough has the lowest percentage (3.5%).
- In 1988, 41,438 or 51.0% of all Alaska Natives still live in largely Native Census Areas where Natives make up more than half of the population.
- The area of Alaska with the oldest population is Southeast. The Northern and Southwestern regions have the youngest median age.
- While the largest number of Senior citizens live in Anchorage and Fairbanks North Star Boroughs, senior citizens are most disproportionately represented in Haines Borough, Wrangell-Petersburg Census Area, and Ketchikan-Gateway Borough.

Sex ratios (males per 100 females) are not unusually high in Alaska. However, the highest sex ratios in the state occur in military, fishing, and mining areas of the state. The lowest sex ratios occur in the more urban areas of the state.

## ESTIMATES FOR SPECIAL POPULATIONS AND AREAS

- In 1988, there were approximately 24,064 military personnel in Alaska, slightly higher than in 1980. The proportion of military personnel within the state has declined from 5.5% of the state's population in 1980 to 4.5% in 1988. Military dependents in 1988 made up another 30,351 persons, making the proportion of military and dependents in Alaska approximately 10.2% of the state's population.
- Estimates for House and Senate Districts suggest that a number of districts will be up for redistricting after the 1990 census.
- Estimates for Native population living in Alaska Native Regional Corporation areas suggest that the largest growth in Native population since 1980 has occurred in Cook Inlet, Calista, Doyon, and Sealaska Corporation areas.

## POPULATION ESTIMATES FOR PLACES

- Twenty places in Alaska in 1988 were urban by U.S. Census Bureau Standards (2,500 persons or more).
- Sixty-seven percent of the population in Alaska lived in urban areas in 1988.
- Sixteen additional places had between 1,000 and 2,500 persons. These places contained another 5.0% of the population.
- In 1988, there were 151 incorporated cities and 140 Census Designated Places in Alaska.

# CHAPTER 2

# ALASKA STATE POPULATION

## INTRODUCTION

This chapter discusses population trends for Alaska. This is followed by a section on components of population change which include births, deaths, and migration. Lastly there is a discussion of the age/sex and race composition of the state.

Statewide population is available for 1988 and 1989. Data on age, sex, and race composition for census areas, boroughs, and places are currently available only for 1988. Borough, census area and place estimates will be released first as a press release during the summer of 1990. 1990 U.S. Census counts will be released early in 1991. Social and economic data from the 1990 census will be released in late 1991 or early 1992.

### Table 2.1

## ANNUAL COMPONENTS OF POPULATION CHANGE FOR ALASKA, 1945-1988

| June 30 to July 1 | End of Period Population | Population Change | Average Annual Rate of Change | Components Of Change | | | |
|---|---|---|---|---|---|---|---|
| | | | | Births | Deaths | Natural Increase | Net Migrants |
| 1945-46 | 103,000 | | | 2,050 | 1,220 | 830 | |
| 1946-47 | 117,000 | 14,000 | 12.73 | 2,490 | 1,200 | 1,290 | 12,710 |
| 1947-48 | 126,000 | 9,000 | 7.41 | 2,890 | 1,180 | 1,710 | 7,290 |
| 1948-49 | 132,600 | 6,600 | 5.10 | 3,300 | 1,190 | 2,110 | 4,490 |
| 1949-50 | 137,100 | 4,500 | 3.34 | 3,620 | 1,220 | 2,400 | 2,100 |
| 1950-51 | 160,000 | 22,900 | 15.42 | 4,110 | 1,310 | 2,800 | 20,100 |
| 1951-52 | 185,500 | 25,500 | 14.76 | 5,130 | 1,310 | 3,820 | 21,680 |
| 1952-53 | 193,800 | 8,300 | 4.38 | 6,270 | 1,280 | 4,990 | 3,310 |
| 1953-54 | 200,100 | 6,300 | 3.20 | 6,910 | 1,240 | 5,670 | 630 |
| 1954-55 | 206,500 | 6,400 | 3.15 | 7,190 | 1,200 | 5,990 | 410 |
| 1955-56 | 212,400 | 5,900 | 2.82 | 7,480 | 1,220 | 6,260 | -360 |
| 1956-57 | 218,600 | 6,200 | 2.88 | 7,730 | 1,240 | 6,490 | -290 |
| 1957-58 | 220,100 | 1,500 | 0.68 | 7,450 | 1,200 | 6,250 | -4,750 |
| 1958-59 | 224,000 | 3,900 | 1.76 | 6,830 | 1,170 | 5,660 | -1,760 |
| 1959-60 | 230,400 | 6,400 | 2.82 | 7,290 | 1,250 | 6,040 | 360 |
| 1960-61 | 236,700 | 6,300 | 2.70 | 7,560 | 1,300 | 6,260 | 40 |

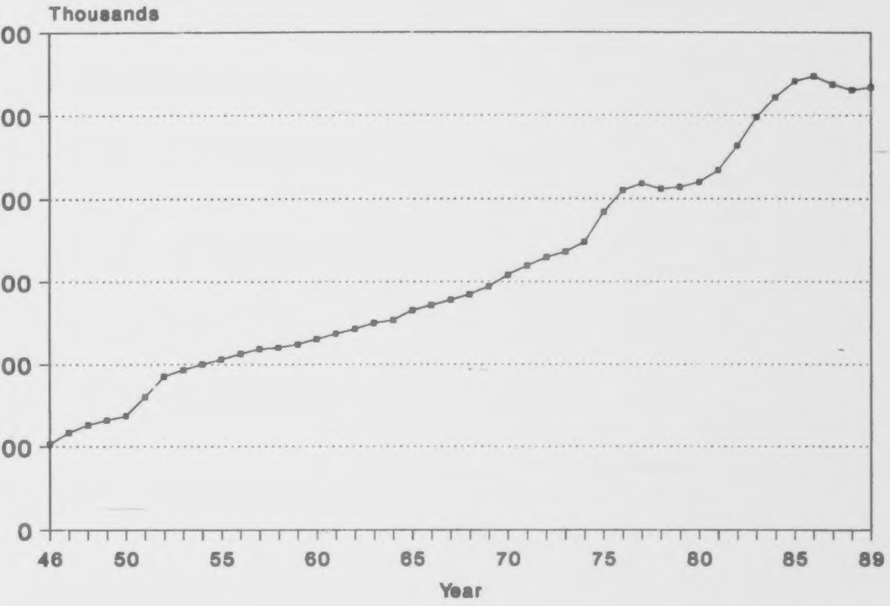
ALASKA POPULATION TRENDS 1946 TO 1989



Source: Alaska Department of Labor, Research & Analysis

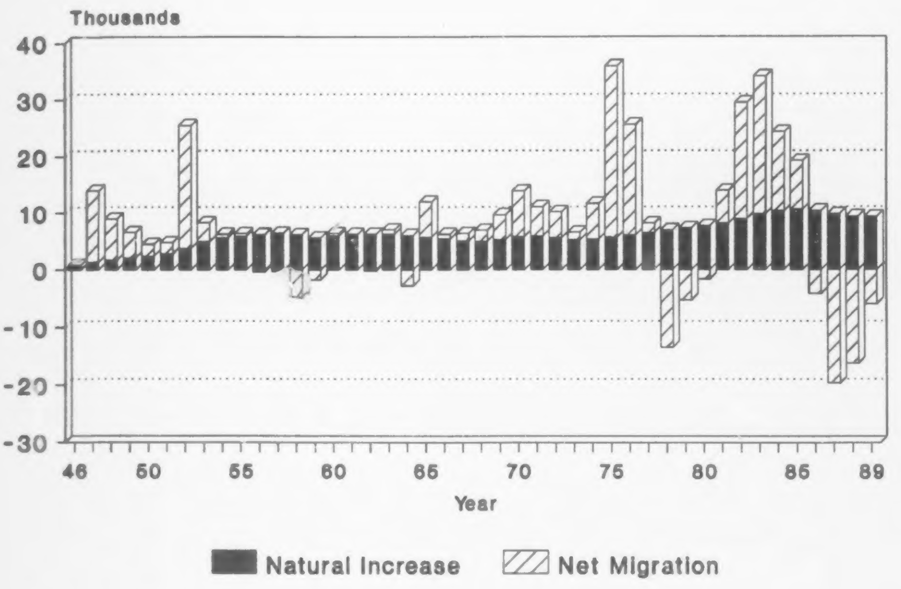
## POPULATION TRENDS

The population estimate for the United States including Armed Forces overseas was 246,329,000 for July 1, 1988 and 248,762,000 for July 1, 1989. The Alaska Department of Labor estimated that the resident population of the state on July 1, 1988, was 531,000. By July 1, 1989, Alaska's population was 534,400. Counting the District of Columbia there are 51 "states" for population purposes. Alaska is currently the fiftieth largest state in area. Despite its large size, Alaska is one of the smallest states by population. Only Wyoming whose population on July 1, 1989, was estimated to be 475,000, was smaller. The next largest state is Vermont, whose 1989 population was estimated at 567,000.

Land area in Alaska covers 570,833 square miles, or 15.8% of the total land area of the United States. In 1989 Alaska's population made up 0.21% of the population of the United States. Alaska is almost 67% urban. That is, 67% of its population lives in places of 2,500 persons or more. Overall Alaska had an average of .9 persons per square mile in 1988. Excluding Anchorage, which contained 42% of the state's population, Alaska averaged 0.54 persons per square mile. Population densities for boroughs and census areas will be found in Table 3.3. Most Alaskans live in towns and villages or clustered settlements. Few live alone in isolated rural areas. As a result, great sections of Alaska remain almost uninhabited.

Figure 2.2

ALASKA COMPONENTS OF GROWTH 1946 TO 1989



Source: Alaska Department of Labor, Research & Analysis

Prior to the gold rush the population of Alaska was officially quite small. The early territorial censuses were not very complete. The earliest census in 1880 showed 33,426 persons. The great Gold Rush doubled the state's population between 1890 and 1900. After the turn of the century, the population of Alaska remained very stable for the next 40 years. The 1900 population was reported at 63,592 and by 1939 the population was still only 59,278.

The opening of Alaska with the construction of the Alcan Highway and World War II dramatically changed the growth of the State. Population growth in Alaska since World War II has been dramatic, as shown in Table 2.1 and Figure 2.1. The military population and their dependents have played a substantial role in the growth of the state, and still makes up 10% of the state's population. Prior to World War II, Anchorage had fewer people than Juneau. Because of the military buildup related to World War II and Korea, Anchorage is nine times larger than Juneau today.

The period from the end of World War II until 1952 was a period of very rapid growth for the state, with the average annual rate of change[1] being 9.5% per year. From 1952 to 1965, Alaska underwent a much slower, smoother growth with an average annual rate of change of 2.7% per year. At statehood in 1959, Alaska had approximately 224,000 people. During the period from 1965 to 1973 population growth gradually increased, to a level of 3.0% per year.

The oil pipeline began to affect population growth in 1973, peaking in 1975.

The average annual rate of change during this period was 6.6% per year. The completion of the pipeline construction "boom" was clearly followed by a "bust" during the 1976-80 period. During 1977-78, Alaska had a population loss of about 6,400 people. The net loss of people as a result of migration in that year was over 13,400 persons. The annual rate of change over the four year period, however, averaged 0.6% per year.

Between mid-1980 and mid-1985, Alaska experienced another boom. This boom resulted from construction and infrastructure development fueled by a combination of state spending based on oil revenues, major federal expenditures, and private development. As a result, Alaska's population grew by a phenomenal 25% in five years, making it the most rapidly growing state in the nation. The most substantial growth occurred in the 1981-1983 period during which the annual rate of change averaged 6.8% per year. The pace of growth began to slow during 1983-84 with a rate of change of 4.8% and declined further in 1984-85 as the rate of growth slowed to 3.6%.

During the period from 1985-88, Alaska experienced another recession similar to that of 1977-80 but more severe. During the period of most severe retrenchment in 1986-87 the rate of population change declined to -1.8%. The cumulative loss of persons to out-migration in the period 1985-89 was about 45,500 persons as compared to an out-migration of 20,200 during the post-pipeline period. This population loss was equal to about 8.3% of the states peak 1986 population. This is a greater proportional loss than the loss of Spokane, Washington relative to Washington's total population or the loss of San Diego metropolitan statistical area relative to California's total population. By 1989, net out-migration slowed enough to allow the natural increase of births over deaths to produce the first increase in population since 1985. The average annual rate of change for the U.S. during the 1980-88 period was 1.0% per year. Indicators suggest that net migration losses may once again become net migration gains in 1990.

Table 2.2

## MIGRANTS TO AND FROM ALASKA, 1980-1989

| July 1 to July 1 | Net Migrants | In Migrants | Out Migrants | Gross Migrants |
|---|---|---|---|---|
| 1980-81 | 5,794 | 46,678 | 40,884 | 87,562 |
| 1981-82 | 20,574 | 59,617 | 39,043 | 98,660 |

| 1985-86 | -0.75 | 9.60 | 10.35 | 19.95 |
| 1986-87 | -3.52 | 6.76 | 10.28 | 17.04 |
| 1987-88 | -2.96 | 6.20 | 9.16 | 15.35 |
| 1988-89 | -1.03 | 7.47 | 8.50 | 15.96 |

Source: Alaska Department Of Labor, Research & Analysis Demographic Unit

Population change during the next few of years will continue to be strongly influenced by births. Alaska has one of the highest rates of natural increase (births minus deaths) in the nation. This provides a strong force for growth within the state even in periods of net out-migration.

The pace of economic growth, and in turn the future population of Alaska, will continue to depend upon the relative demand for Alaskan resources by the U.S. and world economies and federal spending and policy restrictions as they affect Alaska. There is little doubt that Alaska like most western states will continue to have a "Boom-Bust" economy for many years to come. Despite fluctuations in population growth in Alaska, the overall trend during the post-World War II period has been towards strong posi-

tive growth. Alaska has had over a fivefold increase in population since 1946.

The physical resources of this state will continue to be unique. Demand to exploit Alaskan minerals such as oil, gold, and coal remain strong. Fishing and forestry will continue to play a role in Alaska's future. Increasing demand to access the land for its beauty in the form of tourism will also remain. Beyond the economic considerations, the intangible resource of Alaska as a place of wilderness, beauty, and special way of life will continue to serve, as in the past, to attract migrants to the last frontier.

## COMPONENTS OF CHANGE

Population change is composed of natural increase (births minus deaths) and migration as shown in Table 2.1 and Figures 2.2. In general, natural increase is the fairly stable component of population change. Death rates change very slowly, and while current fertility depends on a variety of factors, the general birth trend does not change direction quickly. Migration is the most unstable component of population change in the state, often changing dramatically from one year to the next.

### Births and Deaths

Nationwide fertility rates have been on the decline since the 1970s, reducing the size of each age group during the remainder of this century. Alaska's fertility has always been, and still is, well above the national average. Nationwide in 1988 there was an average of 1.9 children per family. Alaska currently has one of the highest levels of fertility of any state with 2.3 children per family. Utah continues to have the highest fertility, averaging 2.6 children per family. Trends in crude birth rates for Alaska, its boroughs and census areas can be seen in Table 3.3. For most areas of the state current birth rates are only slightly lower than those seen nationwide during the baby boom of the 1950s.

Between July 1, 1988, and July 1, 1989, 11,408 persons were born in Alaska and 2,057 persons died, resulting in a net natural increase of 9,351 persons. This translates into a growth of 1.8% per year as a result of natural increase alone. Births each year are equivalent to about 2.1% of the beginning population. Approximately 0.4% of the population in Alaska dies each year.

Most of the growth in Alaska Native population is due to natural increase. Birth rates among Alaska Natives are currently very high. In 1988, the crude birth rate for Alaska Natives was 32.0 per 1,000 and the crude death rate was 6.6 per 1000 for a natural increase of 2.5% per year. For Alaska Natives, the average number of children is currently 3.6. In 1970, the average number of children for

* Alaska Dept. of Labor Estimate based on adjustment of U.S. Census data.

Source: 1980 Census of Population & Housing and Special U.S. Census tabulations.

Alaska Native families was 4.6. The number declined to a low of 2.7 in 1976, and has been slowly rising each year since.

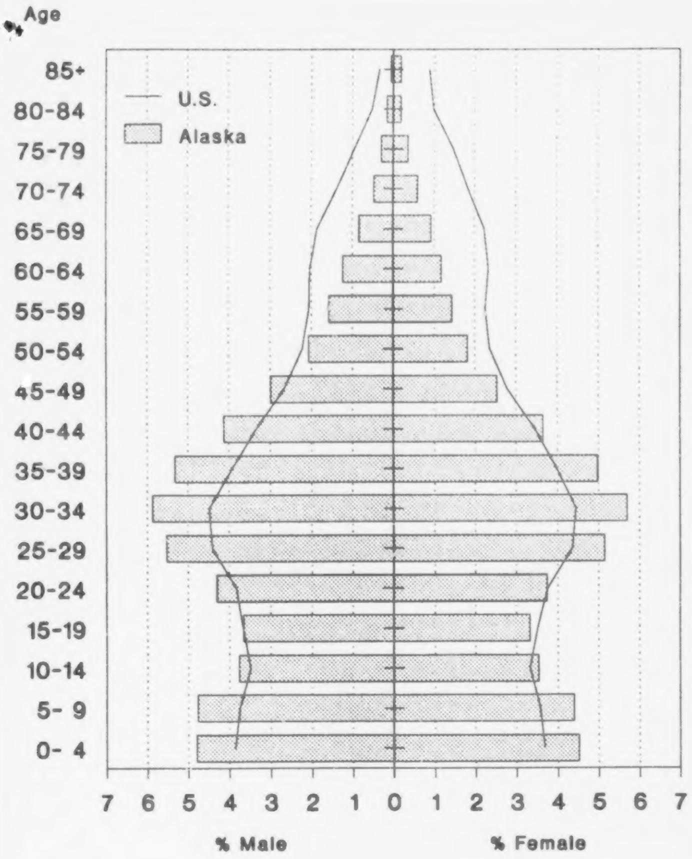
In contrast, the crude birth rate for White Alaskans was 19.8 per 1,000 and the crude death rate was 3.6 per 1,000 for a natural increase of 1.6%. For White Alaskans, the average number of children in 1988 was 2.1. The size of White families in Alaska has been relatively stable since the mid 1970s.

## Migration To/From Alaska

As seen in Figure 2.2, migration to Alaska has historically varied widely from year to year. As a result, it is difficult to talk of typical patterns of migration to the state. The highest post-World War II proportional growth due to migration occurred during the buildup for the Korean War in 1950-51 (14.7%), 1951-52 (13.6%). Rapid growth also occurred during World War II represented here by the statistics for 1945-46 (12.3%). In part, the high percentages were a result of a small population base in these years. While the net migration for 1981-82 and 1982-83 was numerically larger than that for

Figure 2.3

### ALASKA AND U.S. POPULATION PERCENT DISTRIBUTION BY AGE AND SEX, 1989



Source: Alaska Department of Labor, Research & Analysis

1950-51 and 1951-52, it was proportionally much smaller. By 1983, the net influx of 24,300 migrants accounted for only 5.2% of the population.

The largest single numerical increase due to migration (30,222 or 8.7%), occurred during pipeline construction in 1974-75. The largest numerical loss (-19,645 or -3.6%), occurred in 1986-87. This loss was larger than the -13,414 or -3.2% loss which occurred at the end of the pipeline construction in 1977-78.

Historically, the majority of growth from migration in the U.S. tends to occur in relatively few of the 3,139 counties. Most communities in the U.S. attract relatively few migrants each year. Because the late teens and twenties are the ages of highest migration, most communities provide a pool of young migrants who usually leave the communities of their birth to find better opportunities elsewhere.

Migration statistics are derived from change of address on IRS tax returns. Alaska tends to have one of the highest level of in, out and gross migration of any state in the union. During 1987-88, 50,103 or 9.2% of Alaska residents left the state and some 33,909 persons or a number equal to 6.2% of Alaska's residents entered the state. The net loss due to migration was about 1.0%. These migration rates include rotation of military personnel in and out of the state. The military probably accounts for about 20% of the in, out and gross migration flow of the state each year.

The highest turnover is for persons in their twenties and children under 5. Statistically the average length of stay for a 21 year old in Alaska is 9.9 years for males and 13.6 years for females. This means that of a group of Alaska men currently age 21, one can expect 50% to have left the state by about the age of 31.

In general, people move short distances as opposed to long distances. Migration flows also move in streams and counter-streams. This means states that contribute more migrants in times of prosperity in Alaska are the same ones migrants return to when the Alaskan economy falters. Table 2.3 shows the distribution of migration to and from Alaska by region and Table 2.4 shows the distribution of migrants to and from Alaska by State.

In regional terms, the Pacific Coast, Mountain States, South Atlantic and the West South Central Regions accounted for 71.7% of our total gross migration. In 1987-88, these four regions accounted for 67.7% of the immigrants and 74.4% of the out-migrants.

In terms of specific states, two thirds of the Alaska's gross migration is with Washington (14.7%), California (12.6%), Oregon (6.4%), Texas (5.6%), Florida (3.9%), Arizona (3.6%), Colorado (3.0%), Overseas Military (2.9%), Virginia (2.4%), Idaho (2.1%), North Carolina (2.0%), Michigan(2.0%), Georgia (1.9%), New York (1.9%) and Montana (1.8%). The movement to/from a number of these states is heavily military.

Migration to and from the state is in part dependent upon federal military and program policies. Migration is also strongly dependent upon economic opportunities in Alaska relative to the economies in the sending and receiving states, particularly in the Pacific and Mountain regions.

As shown in Table 2.2, changes in migration to/from Alaska are more a result of the decline in in-migrants to Alaska than changes in the out-migrants from Alaska. A net loss or gain results from an increase or decrease in the in-migrants relative to out-migrants. The higher the rate of gross migration or turnover, the more unstable the population is. Thus one cannot always tell by observing what appears to be a net gain or loss of population whether changes in in-migration or out-migration are the cause of the change. What appears as massive out-migration may be a normal 10% out-migration with a sharp decline in in-migrants to the state.

Figure 2.4

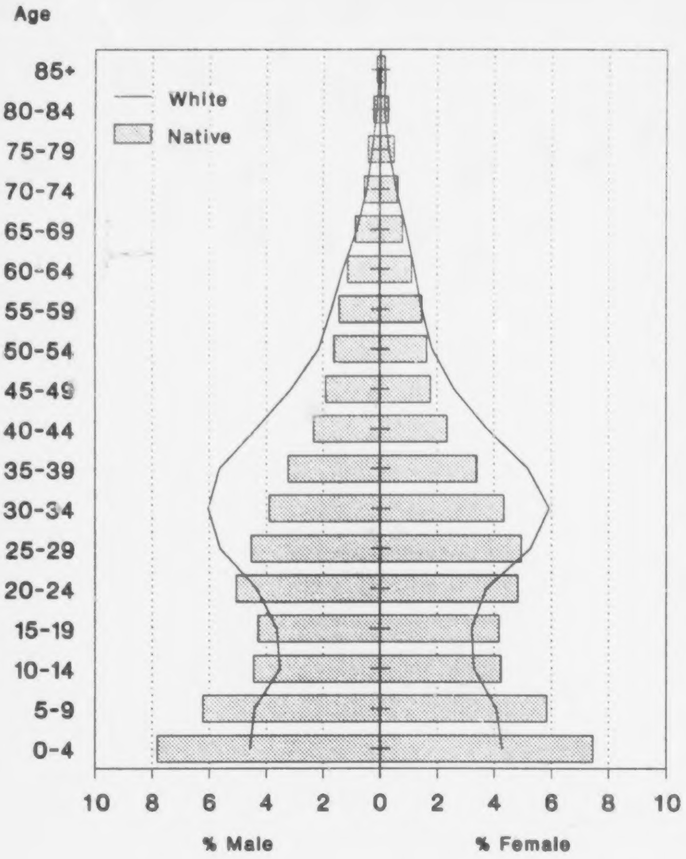
Figure 2.5

**ALASKA NATIVE & WHITE POPULATION, PERCENT DISTRIBUTION, BY AGE & SEX, 1988**



Source: Alaska Department of Labor, Research & Analysis

Most of the fluctuation in migrants during the 1980s are accounted for by Non-Native migration to/from the state. While there has historically been a relatively large migration flow of Alaska Natives to and from the State each year, the flows have been pretty well balanced. The net effect has produced an almost negligible gain or loss of Alaska Natives each year due to migration.

Population in Alaska is also very subject to seasonal fluctuations. While the exact amount of seasonal population is currently unknown, an estimate of the annual average number of nonresidents workers present in Alaska based on quarterly statistics would be about 23,800 for 1988. The seasonal high quarter which occurs during the summer months, would add another 8,400 nonresident workers over the annual quarterly average. While the number of dependents per nonresident worker is unknown, one might assume that seasonal workers in Alaska would tend to bring few dependents with them. It is possible, therefore, that the nonresident population in the state at any given point in time may be equal to about 4-5% of the States resident population. The midsummer "de facto" nontourist, nonresident population may be roughly on the order of 6% of the resident population.

## POPULATION COMPOSITION

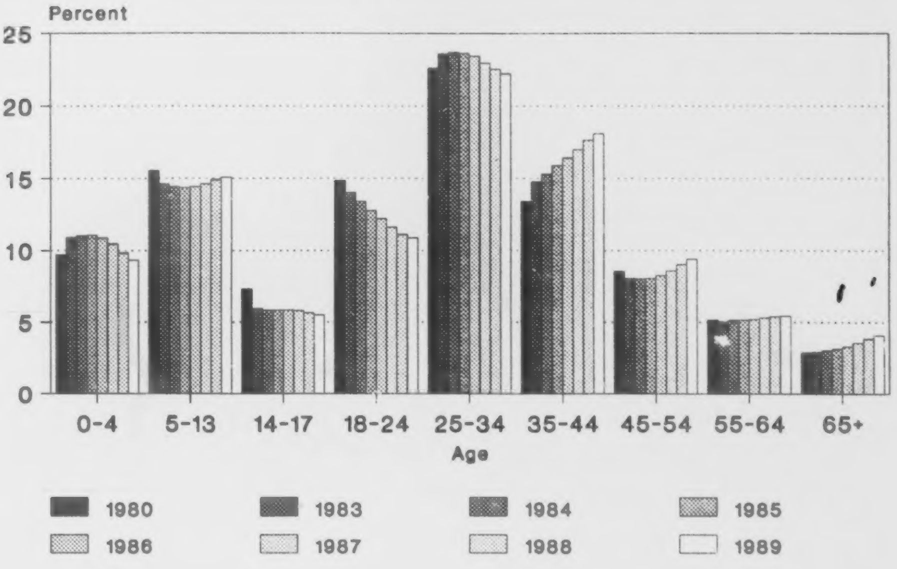
### Racial Composition

Throughout most of Alaska's history, little reliable data has been available on Alaska Natives. This was particularly true before the 1929 Territorial Census. In 1929, there were some 29,983 Alaska Natives in Alaska and they made up 50.6% of the State's population. While their numbers have grown rapidly since 1929, they have not grown as fast as the non-Native population. The proportion of the Alaska Natives has declined steadily over time.

The 1980 census showed that , persons, or 22.9% of the population of Alaska, considered themselves to be some race other than White. The number and proportions of persons by race and tribal group were as follows: Of the estimated 531,000 persons in Alaska in 1988, Native Americans made up 81,200. For these estimates, all Native Americans living in Alaska will be referred to as Alaska Natives, even though a small percentage (0.8%) of the Native Americans living in Alaska belong to continental United States tribal groups. Approximately half of the Native Americans belonging to tribes from the lower 48, were born in Alaska. On the other hand, about 20,000 or 20% of all Alaska Natives are estimated to be living outside of Alaska. The economic boom of the early 1980s brought many non-Natives to the State. As a result, the proportion of Alaska

Figure 2.7

**ALASKA POPULATION BY AGE PERCENT DISTRIBUTION 1981 TO 1989**



Source: Alaska Department of Labor, Research & Analysis

Natives dropped from 16.0% in 1980 to 15.3% in 1988. Alaska Native make up 4.8% of all Native Amaricans in the U.S.

The White population accounted for 401,100 persons or 75.5% of the population in 1988. Other races, primarily Black and Asian and Pacific Islanders account for 48,700 person or 9.2% of the population in 1988. These groups are up from 12,480 or 7.0% in 1980. The Black population of Alaska is primarily military. While the proportions of Black and Asian populations are very uncertain, there has been a fairly large amount of Asian immigration to Alaska in the 1980s. In 1988, some 989 immigrants were admitted to Alaska. Fifty-six percent were from the Philippines and Korea. This immigration may be reflected in a disproportionate growth for Asian and Pacific Islanders. Based on the pattern of immigration for Asians and births and deaths for Blacks and Asians in Alaska, a crude estimate of the number of these minorities in 1988 would be approximately 22,030 Blacks (4.1%) and 18,170 Asian & Pacific Islanders (3.4%).

It is impossible to provide a good estimate the current population of Hispanic Origin in Alaska because of the lack of demographic indicators by ethnic group. If the Hispanic population of Alaska had grown at the national rate for the period 1980-1988, the Hispanic population would be on the order of 12,100 (2.2%) by 1988. School enrollment statistics would tend to support the view that the current Hispanic population is probably not higher than this number.

## Age/Sex/Race Composition

Tables 2.6 through 2.13 show Alaska's population by detailed age, race and sex characteristics for the period from 1988 back to 1980 and detailed age and sex for 1989.

The size of each age group in the population under forty has been affected by several events. The first key event was the "baby boom" which began after World War II. It peaked during the late 1950s and early 1960s. The boom occurred when the American family began to average one more child per family, compared to the depression and war years, and the current national family size of about two children. In addition, the age at first marriage dropped and children were spaced a little closer together than in the

Alaska Department of Labor, Research & Analysis

preceding decades. During the late 1960s and 1970s, the average family size began to decline. This was due to increasing female labor force participation, changing life styles, and better family planning. Currently U.S. families are well planned and small averaging slightly less than two children.

In general, Americans are delaying the birth of children after marriage and having children farther apart. Marriage is being postponed until later and rates of divorce are high. Fertility in Alaska reached a low point in 1973 and has increased slowly since that time up to 1986. The number of children being born each year is increasing mainly because the "baby boom" generation is passing through the key child bearing ages. Births to "baby boomers" are not as high as they could have been. The "baby boom" generation has married later, postponed children and had fewer children to date. The relatively young average age of the Alaska population makes for many households with young children.

While these trends are reflected as part of the changing age structure of Alaskans, fertility has less of an impact on the population than does migration. Migration is particularly high for 18-35 year olds and their young children under school age. Fertility has been declining steadily since 1986. This decline has been correlating with negative net migration.

While Alaska Natives currently make up 15.3% of the State's total population in 1988, they represent far more of the population of certain age groups. For instance, as shown in Table 2, 23.8% of the population under five are Native. Of the population over 65, 18.1% are Native.

## Specific Age Groups

The growth trends for various age groups may differ sharply from that of the population as a whole. This is due to differences in historical patterns of fertility, mortality, and migration by age. The population trends for age groups are found in figure 2.6. The population by single year of age/sex for 1989 and by age/race/sex for 1988 are found in tables 2.7 and 2.8-2.9 respectively.

There were some 49,753 children under the age of 5 in 1989 compared with 52,219 in 1988. They make up 9.3% of the state's population. Between 1980 and 1985 there was a 54% increase in the number of children under 5, indicating that this age group had been growing more rapidly than the total population. Between 1985 and 1989 the number of children under five has declined by 17.1% due to a net loss due to migration.

The population 5-13, those persons of elementary and junior high school age, grew rapidly until 1975, declined during the late 1970s but have increased again to about 80,655 by 1989 (79,205 by 1988). Currently 15.1% (14.9, 1988) of the state's population is in these ages. The 1988 population 5-13, those persons of elementary and junior high school age, is made up of 56,055 (70.8%) White, 15,499 (19.6%) Alaska Natives and 7,651 (9.7%) Other Races.

The population of high school age children has been much more stable over the years. Alaska's adult population has traditionally been too young to have large numbers of high school aged children. In the past, some high school age students have attended boarding schools outside Alaska. This is less true today. In 1989, there were almost 29,374 persons 14-17 in Alaska (30,130 in 1988. They make up 5.5% of the population (down from 5.7% in 1988). This age group is less subject to changes in migration flows than the younger age groups because their parents older and more stable workers. The population of high school age children 14-17 in 1988 was composed of 21,796 (72.3%) White, 5,461 (18.1%) Alaska Native, and 2,873 (9.5%) Other Races composition.

While the number of young adults 18-24 nationwide is declining dramatically, this age group continued to increase in Alaska to a high of 70,200 in 1984. This age group is the most immediately subject to increases and declines in economic conditions. This group has declined since 1984 and by 1989 numbered 58,183, a decrease of 17.1% in five years. In 1988, Whites made up 43,215 (73.1%), Alaska Natives 10,813 (18.3%) and Other Races 5,104 or (8.6%) of the 18-24 population of Alaska.

The population 25-34 is composed of young adults in the prime ages for family and household formation. By our estimate, this age group peaked at 128,400 in Alaska in 1986. This age group had shown an increase of almost 41.3% since 1980. No other age group has had a greater numerical increase than this one. It is the families in this age group that contributes to the rapid growth in the number of children under 5. By 1989, the persons in this age category declined to 118,746. This is a loss of 7.5% of the young householders since 1986. In 1988, Whites made up 91,603 (76.5%), Alaska Natives 14,386 (12.0%) and Other Races 13,680 (11.4%) of the population 25-34.

The population 35-44 represents the leading edge of the post World War II "baby boom". Rapid growth in this age group since 1980 has resulted from an increased migration of more established families as well as the aging of the Alaska population. In spite of overall losses in the state's population in the 1986-87 period this age group continued to grow reaching its highest level in 1989 of 96,604 persons. This age group has increased by 78.8% since 1980. This is proportionally the most rapidly growing age group. In 1988, Whites made up 75,918 (81.1%), Alaska Natives 9,170 (9.8%) and Other Races 8,564 (9.1%) of this age group.

The ages 45-54 and 55-64 have traditionally been ages at which many Alaskans begin to move south. These age groups have continued to grow throughout the 1980s. They were also at their highest level in 1989. We estimate there were about 50,170 persons 45-54 and 29,030 persons 55-64 in the state. In general, middle aged Alaskans were more willing to stay in Alaska during the 1980s than in prior decades. Of the 45-54 year olds in 1988, Whites made up 38,838 (81.2), Alaska Natives 5,623 (11.7) and Other

Races 3,396 (7.1%). Whites made up 22,715 (79.0%), Alaska Natives 4,192 (14.6%) and Other Races 1,832 (6.4%) of these 55-64 year olds.

Our 1989 estimate of the number of persons 65 years old or over is 21,885. Considering the size of the population currently 55-64, the number of senior Alaskans is likely to continue to increase rapidly in coming years. The estimate suggests a 89.5% increase in older Alaskans since 1980. Alaska has one of the smallest proportion of persons over 65 (4.1%)in the nation. We also have one of the largest percentage increases in the population over 65 of any state. Of the elderly in 1988, 15,466 (75.8%) were White, 3,689(18.1%) were Alaska Native, and only 1,242 (6.1%) were Other Races.

## Median Age

The population in Alaska is younger than the nation. Further, the Alaska Native population is much younger than the White population because of its high fertility. The 1988 median age in the United States was 31.2 for White males and 33.5 for White females. The median age for White males in Alaska was 30.0 and the median age for White females in Alaska was 30.1 years. This was an increase of 2.6 and 3.5 years respectively since 1980. By contrast, the median age for Alaska Native males in 1988 was 22.4 and the median age for Alaska Native females was 23.5 years, an increase of 1.1 and 2.0 years respectively.

## Voting Age Population

The voting age population in 1989 was 374,618 and 369,466 in 1988. In 1988, Whites made up 287,755 (77.9%), Alaska Natives 47,873 (12.9%) and Other Races 33,818 (9.2%). Although Alaska purges voter registrations every two years, areas with high turnover may contain up to 20% more registered voters than population due to turnover.

## Dependency

Dependency ratios show how large a burden of support is placed on the working age population by the young and old segments of the population.In 1989, statewide every 100 person of working age supported 45.3 children and 6.2 persons over 65. In 1988, every 100 persons of working age supported 46.3 children and 5.8 persons over 65. Alaska Natives of working age have a large dependency burden. For every 100 Native person of working ages (18+) in 1988, there are 75.4 youth and 8.3 elderly persons to be supported. In contrast, for every 100 White Alaskans in the working ages (18+), there were only 41.6 youth and 5.7 elderly persons to be supported. Since the average income in the more heavily Native census areas of the state have not grown at the same rate as the more White urban areas of the state, Alaska Natives must make scarce resources go even farther.

## Sex Composition

In 1989, 257,504 persons, or 8.2% of Alaska's population, were female compared to .3% female for the United States in 1988. Traditionally, a high ratio of males to females has been associated with the American frontier. The myth that Alaska has substantially more men than women, however, continues to be perpetuated in the popular press. A few Alaskan communities tend to be more heavily male because employment may be transient or concentrated in occupations which have traditionally employed mostly males. Most communities, however, have sex ratios more in line with the rest of the nation. The presence of military installations, logging, fishing, or mining operations are the main sources of distortion for the sex ratio in the state. The young age of the population also increases the overall male proportion slightly. Older populations have more women because of the greater life expectancy among women at older ages.

The highest sex ratios by age in 1988 occurred are among Whites 20-24, 40-44 and 45-49. The sex ratio for Whites are 20-24 and 40-44 was 116 (That is 116 men for every 100 women) and the sex ratio for 45-49 is 120 men for every 100 women. The higher sex ratio for 20-24 year olds are a result of the large military population in the state.

In 1988, there was only a small difference in the sex composition by race. The White population in Alaska was 47.9% female while among Alaska Natives 49.9% was female. The comparable ratio of the United States is 51.3%.

---

[1] An average annual rate of change is a standardized statistical measure of the rate of change which ca! the change for any time period to a yearly rate.

# CHAPTER 3

## POPULATION & HOUSEHOLD ESTIMATES

### FOR BOROUGHS & CENSUS AREAS

## INTRODUCTION

This chapter provides detailed estimates of population by race, age and sex for Boroughs and census areas of Alaska. The detail presented here allows one access to geographic variation for population, components of change and population composition.

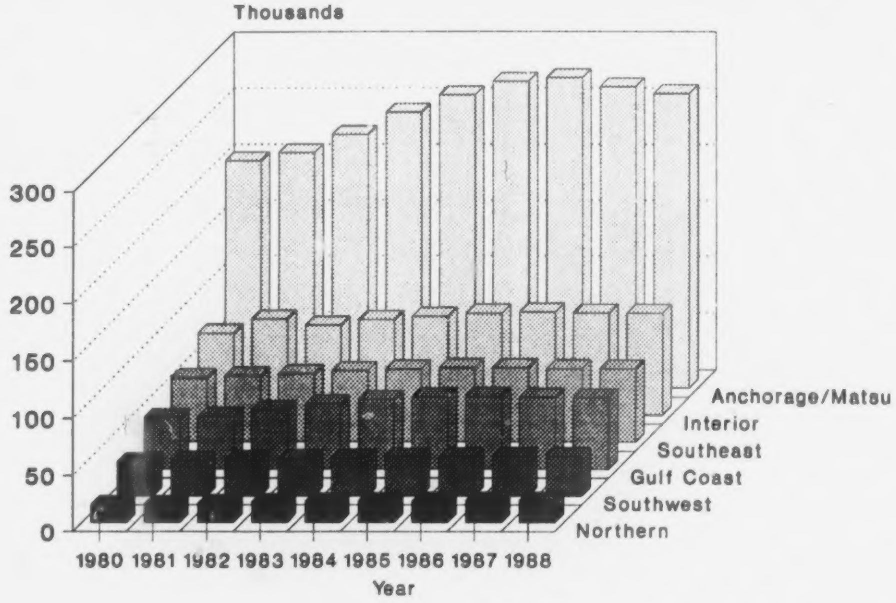
Unlike the rest of the United States which is entirely organized into counties, Alaska still remains predominately unorganized. Currently, there are 14 boroughs which are the equivalent of county governments in the rest of the United States. Three of these boroughs are city/boroughs: Anchorage, Juneau, and Sitka. These have the equivalent of city/county governments. Miami/Dade County in Florida and Oklahoma City/County are also examples of this type of government. The other boroughs are: Bristol Bay Borough, Fairbanks North Star Borough, Haines Borough, Kenai Peninsula Borough, Ketchikan Gateway Borough, Kodiak Island Borough, Matanuska-Susitna Borough, North Slope Borough and the newly incorporated Northwest Arctic Borough (formerly Kobuk Census Area), Aleutians East Borough (formed Oct 23,1987) and Lake and Peninsula Borough (formed April 25, 1989). Each has independent incorporated communities within its boundaries.

The remaining unorganized territory has been divided into census areas for enumeration by the U.S. Census Bureau. While these are only statistical units, they are widely recognized by all federal and most state agencies as county equivalents for Alaska. Some program service areas, however, have different geography. While not universal, many of the boundaries of the census areas tend to follow native regional corporation boundaries. The reader should refer to the maps that accompany the place estimates in this publication if uncertain as to how to identify borough and census area boundaries of Alaska.

The boundaries of the new Northwest Arctic Borough correspond to Northwest Arctic Native Association boundaries and involved the transfer of 3,298 square miles of land from North Slope Borough to the Northwest Arctic Borough. No population was involved in this land transfer, so that the historical series is still 100% compatible with the Kobuk Census Area and North Slope Borougn for 1980 onward. Aleutians East Borough was formed out of the Aleutian Island

Figure 3.1

POPULATION BY LABOR MARKET REGION, 1980 TO 1988



Source: Alaska Department of Labor, Research & Analysis

Census Area, a small area of land was transferred from Dillingham Census Area at the time of formation. It contained no people. Similarly, Lake and Peninsula Borough was formed out of the Dillingham Census Area. At the time of its formation a segment of the Dillingham Census Area containing no population was annexed to the Kodiak Island Borough.

## REVISION OF THE BOROUGH AND CENSUS AREA ESTIMATES FOR 1980-1988

Estimates done by the Alaska Department of Labor since 1980 differ each year from that produced in earlier years because of the rebenchmarking of the underlying data series. Minor changes have been made in the state estimates and thus the Borough and Census Area estimates since those published in the 1986 Population Overview.

# POPULATION TRENDS

Alaska grew by 111,200 persons between July 1, 1980 and July 1, 1988, an increase of 26.5% in eight years. The state's population declined by 16,600 in the period July 1, 1986-July 1, 1988. The distribution of that population and the growth for Alaska boroughs and census areas by economic region for the period from 1980-88 can be seen in Table 3.1. Population trends for economic regions can also be seen in Figure 3.1. Table 3.2 shows new estimates of the population, occupied housing units and major group quarters for boroughs and census areas for 1980 and 1988. Table 3.3 shows the components of change, average annual rates of change, proportion of state population and population density for economic regions, boroughs and census areas for 1970-88.

In 1988, 222,950 persons, or 2.0% (Table 3.1) of Alaska's population lived in the Municipality of Anchorage. This is very similar to the Municipality's annual survey results for July 1, 1988 of 218,979[1]. The five largest boroughs or census areas are: The Municipality of Anchorage, Fairbanks North Star Borough (72,361), Kenai Peninsula Borough (39,949), Matanuska-Susitna Borough (37,985), and Juneau Borough (24,621). These contained 4.9% of Alaska's population in 1988. In 1980, these census areas made up only 72.4% of Alaska's population. The remainder of the state contained an estimated 133,134 persons in 1988.

Growth and decline in the 1980s has been mainly in the urban and "suburban" areas of Alaska. During the boom period July 1980 to July 1986, Five census areas accounted for 87.7% of the states growth: The Municipality of Anchorage (+54,844 or 30.1% increase), Matanuska-Susitna Borough (+20,058 or 106.8% increase), Fairbanks North Star Borough (+17,293 or 30.7% increase), Kenai Peninsula Borough (+13,944 or 52.7% increase), and Juneau Borough (+5,910 or 28.8% increase). Growth has been somewhat slower, but still rapid by national standards in the balance of the state. The balance of the state grew by 15,751 or a 13.6% increase between July of 1980 and July of 1986.

Similarly, the four most rapidly growing areas of the 1980s experienced the largest declines in the 1986-88 period. The four census areas with major population losses between 1986 and 1988 are: Municipality of Anchorage (-12,183 or 5.2% decrease), Matanuska-Susitna Borough (-1,989 or 5.0% decrease), Kenai Peninsula Borough (-1,704 or 4.1% decrease), and the Juneau Borough (-1,377 or 5.3% decrease). These four Boroughs accounted for 75% of the losses. Fairbanks North Star Borough (-753 or 1% decrease) would have undoubtedly had a greater share of this loss had it not been for growth related to the addition of the Light Infantry Battalion at Fort Wainwright.

The state declined in population by 16,600 between 1986 and 1988 while the census areas with the largest declines reduced population by 17,253. These declines were offset by marginal population increases in other areas. The areas experiencing population increases were the Norther and Southwest labor market regions. In these areas the population increases were a result of natural increases rather than migration.

* does not include small group quarters or fishing or logging camps

## HOUSEHOLD ESTIMATES

This issue of *Population Overview* marks the first attempt to estimate the number of occupied household and major group quarters for Alaska by census area. These new estimates were undertaken in response to a general demand for more current social and economic statistical information for Alaska's population and by a need to develop checks for review of the 1990 federal census. These estimates and the more detailed ones that appear in chapter 5 are somewhat experimental and refinement of the methodology will be possible only after the 1990 census results are known. Estimates of the number of Occupied households were developed with the aid of Alaska Permanent Fund information, but are not raw Permanent Fund counts. Initial tests against U.S. Census Bureau estimates of occupied households suggest that at least at the census area level they are not seriously in error. We estimate the number of occupied households in Anchorage outside of Eielson and Elmendorf to be about 515 or 0.7% fewer than the Anchorage survey conducted in July of 1988. Even given the differences in time and methodology, this difference is within the standard error for the Anchorage survey.[3]

As shown in Table 3.2., the number of occupied households in Alaska were estimated to be 177,137 in 1988. The number of persons per household remains much the same as in 1980 at 2.91 persons compared to 2.93 in 1980. Households generally range in size from above 3.5-4.6 persons per household in the predominately native areas of North and Western Alaska to 2.6-2.7 persons in Anchorage,and some areas of southeast Alaska such as Juneau, Ketchikan-Gateway and Haines boroughs.

## COMPONENTS OF CHANGE

### Births and Deaths

Births and deaths for census areas and labor market areas are shown in table 3.4. The average birth rate for the State in the 1987-88 period was 21.3 per 1000 population. The highest birth rates can be found in the heavily Native areas of the state: Wade Hampton Census Area (37.4), Northwest Arctic Borough (36.9), Bethel Census Area (29.2), Dillingham Census Area (29.8), Nome Census Area (28.7), North Slope Borough (30.0). The lowest birth rates can be found in areas of Southeast Alaska. These include: Haines Borough (13.7), Juneau Borough (17.9), Skagway-Yakutat-Angoon Census Area (19.4) and Sitka Borough (19.5). Heavily military and fishing areas such as the Aleutians Islands East Borough (23.6), Aleutians West Census Area (23.4), Southeast Fairbanks Census Area (19.9) also have lower fertility. Other areas with lower fertility include Kenai Peninsula Borough (17.7) and Valdez-Cordova Census Area (20.1).

The average death rate for the State in the 1987-88 period was 3.8 per 1000 population. Mortality is currently the highest in heavily Native areas of the state: Northwest Arctic Borough (6.8), Wade Hampton Census Area (7.3), Yukon-Koyukuk Census Area (5.3), Dillingham Census Area (5.7), and Nome Census Area (5.5), North Slope Borough (6.4). For the Native areas, these

Alaska Department of Labor, Research & Analysis, 1989.

higher mortality rates are even more noticeable because of the young age of the populations of these areas. As one might expect areas of the state with older populations will have higher than average death rates: Ketchikan Borough (6.4), Sitka Borough (6.1), Haines Borough (3.0), and Wrangell-Petersburg Census Area (5.7).

The lowest death rates can be found in the following areas: Anchorage Borough (3.2), Matanuska-Susitna Borough (3.4), Fairbanks North Star Borough (3.4), Southeast Fairbanks Census Area (3.7), Juneau Borough (4.0), Prince of Wales-Outer Ketchikan Census Area (4.1), Skagway-Yakutat-Angoon Census Area (4.5), Aleutian Islands West Census Area (1.5), Aleutian East Borough (4.5) and Bristol Bay Borough (1.4). Several of these have young transient segments of population associated with the military or fishing and timber. It is possible in the case of Ketchikan and Prince of Wales-Outer Ketchikan that some death certificates for Prince of Wales-Outer Ketchikan may be erroneously being attributed to Ketchikan.

### Migration

Flows of migrants within boroughs and census areas are made up of people coming from or going to other states and people coming from or going to other areas of Alaska. These net flows for the 1980s are shown in Table 3.4. During 1987-88, for example, the census areas which gained more than 200 persons through net migration were nonexistent. Only three areas had positive in-migration from 1987 to 1988: Prince of Wales-Outer Ketchikan Census Area (+177), Skagway-Yakutat-Angoon Census Area (+75), and Haines Census Area (+31).

In 1987-88, every census area in the state except for the three listed above had some degree of loss through net out-migration. The census areas having losses of about 200 or more were: Anchorage Borough -8,930 (-2.2%), Matanuska-Susitna Borough -1,665 (-2.8%), Fairbanks North Star Borough -1,525 (-0.1%), Kenai Peninsula Borough -1,466 (-2.3%), Juneau Borough -692 (-1.4%), Ketchikan Gateway Borough -320 (1.3%), Aleutian Islands Census Area Balance -284(2.0%), Nome Census Area -262(-0.9%). Space does not allow for a detailed discussion of the detailed migration patterns for boroughs and census areas in this publication. We hope to present the results in our separate Demographic Report series at a later date.

## POPULATION COMPOSITION

### Race Composition

Since statistics on migration by race do not exist, a mixture of current and historic data was used to generate race estimates for geographic areas.

Table 3.3 shows that Alaska Natives have increased in numbers in all Boroughs and Census Areas except Aleutian Islands Census Area Balance, -176 (-4.0%) since 1980. The largest numerical increases have occurred in the Anchorage Borough (4,654), Fairbanks North Star Borough (1,798), Bethel Census Area (1,297), Dillingham Census Area (1,099), Wade Hampton Census Area (952), Northwest Arctic Borough (943), Nome Census Area (867), Yukon-Koyukuk Census Area (853), Juneau Borough (804), Kenai Peninsula Borough (671), Matanuska-Susitna Borough (657), Prince of Wales-Outer Ketchikan Census Area (643), Ketchikan Gateway Borough (621), and North Slope Borough (414).

More Alaska Natives now live in Anchorage (13,607) than in any other Borough or Census Area. Bethel Census Area which had the largest number of Alaska Natives in 1980 dropped into second place with 10,544. The proportion of Alaska Natives increased from 1980 to 1988 in the following census areas: Anchorage Borough, Valdez-Cordova Census Area, Fairbanks-North Star Borough, South-

Alaska Department of Labor, Research & Analysis, 1989.

east Fairbanks Census Area, Yukon-Koyukuk Census Area, Juneau Borough, Ketchikan Gateway Borough, and Aleutians East Borough. Alaska Natives declined as a proportion of the population in all other Census Areas.

In 1988, 41,438 or 51.0% of all Alaska Natives still live in largely Native Census Areas where Natives make up more than half of the population. This show a slight decline from 1980 when this percentage was 54.5%. Because of increased out-migration, the proportion of the native population that lived in census areas with less than six percent native population was 1.7%.

Geographically, the Alaska Native population has shown relatively small redistribution since 1980. In 1980, 15% of Alaska Natives lived in the Anchorage Labor Market Region. By 1988, that proportion had risen to 18.4%. Slight proportional increases were also seen in the Gulf Coast and Interior Regions. Specifically, there has been an increase in the proportion of all Alaska Natives in: Anchorage Borough, Matanuska-Susitna Borough, Kenai Borough, Fairbanks-North Star Borough, Southeast Fairbanks Census Area, Juneau Borough, Ketchikan Gateway Borough, Dillingham Census Area, and Prince of Wales-Outer Ketchikan Census Area. There was a declining proportion of the state's total Native population in all other regions and Census Areas. The changing geographic distribution in part reflects a gradual expected movement of Alaska Natives from small rural native villages to larger mainly white urban centers. It is significant that the degree of change during this period of general rapid urban growth, remained relatively small. These relatively small changes support the strong desire of many Alaska Natives to retain traditional styles of life.

## AGE/SEX ESTIMATES

Table 3.5 shows estimates by five year age groups and sex for the State of Alaska, boroughs and census areas, and labor market regions for 1980 and 1988. These tables show population by sex and five year age groups. Also shown are median age, senior citizen, and working and voting age populations.

### Median Age.

In 1988, the median age in Alaska was 28.9 years. The areas of Alaska with the oldest population are Southeast and Gulf Coast. The census areas with median ages over 30.3 are as follows: Haines Borough (32.7), Juneau Borough (31.6), Ketchikan Borough (31.4), Valdez-Cordova Census Area (31.3), Wrangell-Petersburg Census Area (30.1), Kenai Peninsula Borough (30.6), Skagway-Yakutat-Angoon Census Area (30.5), Matanuska-Susitna Borough (30.3), and Sitka Borough (30.3).

The Northern and Southwestern regions of the state have the youngest median age. With the exception of the heavily military Aleutian Island Census Area, this mirrors the high fertility of these regions. Census Areas with median ages under 26.3 are as follows: Wade Hampton Census Area (22.4), Northwest Arctic Borough (23.8), Bethel Census Area (24.4), North Slope Borough (26.5), and Aleutians Islands Census Area (26.1).

### Senior Citizens

Some census areas have larger concentrations of older Alaskans. The statewide proportion of persons over 65 is 3.84%. In general, the elderly concentrate as the general population do. Thus, of the 20,397 persons over 65 in 1988, 7,340 were in Anchorage Borough, 2,321 were in Fairbanks North Star Borough, and 1,218 are estimated to be in Juneau Borough. Census areas with at least 1% higher greater than average proportion of Senior Citizens are: Haines Borough (8.8%), Wrangell-Petersburg Census Area (6.8%), Ketchikan-Gateway Borough (6.5%), Skagway-Yakutat-Angoon Census Area (6.1%), Bethel Census Area (5.5%), Sitka (5.3%), Juneau (4.9%), Areas with smaller proportion of senior citizens than expected are: Aleutian Island Census Area (1.4%), Bristol Bay Borough (2.7%), Kodiak island Borough (3.0%), Fairbanks North Star Borough ( 3.2%), Anchorage Borough( 3.3%), North Slope Borough (3.3%), and Southeast Fairbanks Census Area (3.4%).

## Sex Ratios

The sex ratio for Alaska in 1988 was 108. That means that there were 108 men for every 100 women. The census areas with the highest sex ratios and the chief cause are as follows: Bristol Bay Borough (154 - King Salmon AFB and fishing), Aleutian Island Census Area (158 - Adak Naval, Air Station and fishing), Kodiak Island Borough (124 - Kodiak Coast Guard Station and fishing), Yukon-Koyukuk Census Area (119 - Armed Forces and Mining), Prince of Wales-Outer Ketchikan Census Area (120 - logging), Southeast Fairbanks Census Area (123 - Ft. Greely), Nome Census Area (116 - Mining), Valdez-Cordova (115 - fishing, mining, oil). The highest sex ratios are not only associated with young military populations but with persons over 40 who migrated to the state when the sex ratios were historically much more imbalanced.

The Census Areas with below average sex ratios are as follows: Juneau Borough (102), Anchorage Borough (103), Sitka Borough (104), and Matanuska-Susitna Borough (106). All of the largest urban areas fall into this category. Anchorage and Fairbanks both have low sex ratios in spite of large Army and Air Force Bases.

# CHAPTER 4

## ESTIMATES FOR SPECIAL POPULATIONS & AREAS

Estimates for special populations and areas, was new last year. It will continue to be expanded in future years to include other frequently requested special population estimates. New this year are estimates of the population by school districts.

### ARMED FORCES POPULATION

The role of Armed Forces population in Alaska has always been significant to the state's population and population growth. Currently the overall Armed Forces population of Alaska is relatively stable. Because of the rapid increase in the civilian population since 1980 the military population has declined as a proportion of the total population of the state. Estimates for 1988 appear in Tables 4.1.

In 1988, there were approximately 24,064 Armed Forces personnel in Alaska, slightly higher (+9.4%) than in 1980. The proportion of military, however, continues to decline from 5.5% of the state's population in 1980 to 4.5% in 1988. Dependents of Armed Forces personnel, in 1988, made up another 30,351 persons. This made the proportion of military and dependents in Alaska 10.2% of the state's population. The census areas with the largest number and proportion of Armed Forces personnel and dependents are: Anchorage Borough (26,741 or 12.0%), Fairbanks North Star Borough (16,616 or 23.0%), Aleutians West (4,403 or 65.7%) Kodiak Island Borough (2,432 or 8.1%), Southeast Fairbanks Census Area (1,536 or 22.5%), and Bristol Bay Borough (283 or 19.5%). The military population has played a very small role in the population increase of the early 1980s. Statewide military and military dependents have increased by only 4,904 since July 1980. The growth of military and dependents has accounted for about 4.4% of the states overall increase between July 1980 and July 1988.

In the Aleutians, increases of about 1,051 military and dependents have offset a general population decline to account all of the 506 person overall growth in the population of this census area since 1980. In Fairbanks North Star Borough, military and dependent populations have grown by 3,860 since 1980, accounting for approximately 21.0% of the borough's growth. In Kodiak, military and dependents have increased about 347 since 1980, accounting for about 9.3% of the growth. The military presence in all other areas of the state has remained virtually constant or declined.

## HOUSE AND SENATE DISTRICT ESTIMATES

The current House and Senate areas were established by the redistricting plan of 1984. These estimates are shown in Table 4.2. Estimates are for 1988. While populations for redistricting purposes were adjusted for military nonresidents, a completely comparable adjustment could not be made with this set of estimates. This adjustment in the 1984 redistricting plan was made using an estimate of the location of off-base military population produced by the Institute of Social and Economic Research. Since these residence patterns may have changed, the only adjustment possible was for on base military nonresidents. It is clear from these estimates that the differential growth of the state in the 1980s will require a number of district shifts following the 1990 Census. The probable size of House Districts in 1990 will be on the order 13,000 residents and the Probable size of Senate Districts will be on the order of 26,000.

## ALASKA NATIVE REGIONAL CORPORATION AREA ESTIMATES

The 12 Alaska Native Regional Corporations in Alaska include all areas of the state except the Annette Island Reserve. The estimated total and Alaska Native populations living within the geographic areas held by the regional corporations are shown in Table 4.5. The boundaries of those corporations are shown in Figure 4.1. The estimates of Native population living within these regions do not necessarily represent shareholders of that corporation.

There has been little change in the distribution of Alaska Native population relative to the different Corporate regions. An increase in the proportion of Natives living inside the Cook Inlet Region is a result of the growth of the proportion of Natives living in Anchorage. There have been slight declines in the proportion of Alaska Natives living in all regions except Bristol Bay, Cook Inlet, and Doyon Corporation Regions.

Numerically, the largest growth in Native population within the Corporate regions has occurred in Cook Inlet (+5,863), Calista (+2,249), Doyon (+2,957), Sealaska (+2,030), and Bristol Bay Native Corporation (1,190). The remaining regions grew by less than 1,000 each in the 1980-88 period.

## SCHOOL DISTRICT ESTIMATES

Population estimates are important to school districts for planning purposes. School districts can allocate resources more effectively once they realize the magnitude of population change. The populations here are for total district populations and not school age populations. From 1980 to 1988, three districts had population increases greater than 100%: Klawock City Schools (131.1%), Matanuska-Susitna Borough Schools (113.2%), and Craig city Schools (106.3%). Six school districts lost total population between 1980 and 1988. These are: Unalaska City Schools (-14.4%), Skagway City Schools (-13.5%), Aleutian Region Schools (-12.3%); Copper River Schools (-8.8%), Pribilof Schools (-4.5%) and Sand Point School District (-1.6%). As with most population descriptions, Anchorage School District contained the largest population (222,950) which was 42% of the state population. Pelican City School District had the smallest population, 247, 0.1% of state population.

# CHAPTER 5

## POPULATION & HOUSEHOLD ESTIMATES FOR PLACES

### INTRODUCTION

This section contains provisional place estimates for July 1, 1988 for all incorporated places, census designated places (CDPs), Alaska Native Villages (ANVs) and the rural balances of both census areas and census subareas. Place estimates are presented here in two forms: census area and alphabetically. The alphabetical listing also includes communities ranked by size in 1988 and 1980. These are found in Tables 5.1 through 5.23 and 5.24 respectively. While revised estimates for July 1, 1981 through 1987 are needed to produce a consistent series back to the 1980 census, resources do not permit revised place estimates. No place estimates were produced for 1987. Previously published estimates for places will not add up to current census area totals. Estimates for prior years should not be used to make a series since estimates have not been revised and methodologies have changed during the decade.

### CHARACTERISTICS OF PLACES

Twenty places in Alaska are urban by U.S. Census Bureau standards of 2,500 persons or more in 1988. Alaska was 66.8% in 1988 compared to 64.3% urban in 1980. There were 16 places of 1,000 to 2,500. These places contained an additional 5.0% of the population in 1988. In 1980, places of between 1,000 to 2,500 contained 7.6% of the population. There were 44 places between 500 and 999 accounting for 27,823 or 5.2% of the population. In addition, 60 places of 250-499 accounted for 21,372 or 4.0% of the population and 155 places of less than 250 accounted for 16,785 or 3.2% of the population. The remainder of the population lives in the rural balance of the state outside of incorporated places and CDPs.

There were 84,024 persons or 15.8% of the states population living outside of places in 1988. Most (90.5%) of these persons were concentrated around cities and CDPs or along the highways in Fairbanks North Star Borough (29,689), Matanuska-Susitna Borough (27,967), Kenai Peninsula Borough (14,193), Kodiak Island Borough (4,159), Southeast Fairbanks Census Area (1,736), Valdez-Cordova Census Area (1,426) and Yukon-Koyukuk Census Area (1,046).

## Cities

In July of 1988, there were 151 incorporated cities in Alaska. One hundred thirty-five, or 89% of cities in Alaska, conducted local censuses, or had full population count rosters since 1980. In 1988 alone, 37 cities or 25% of the communities, conducted acceptable censuses. Three of the twelve boroughs, Kenai, Kodiak and Ketchikan, have also conducted full censuses since 1980.

In 1988, 17 cities were considered urban by U.S. Census Bureau definition:

| | |
|---|---|
| 1. Anchorage City/Borough | 222,950 |
| 2. Fairbanks City | 28,251 |
| 3. Juneau City/Borough | 24,621 |
| 4. Sitka City/Borough | 8,257 |
| 5. Ketchikan City | 7,730 |
| 6. Kodiak City | 6,651 |
| 7. Kenai City | 6,543 |
| 8. Bethel City | 4,390 |
| 9. Homer City | 4,338 |
| 10. Soldotna City | 3,733 |
| 11. Nome City | 3,403 |
| 12. Wasilla City | 3,342 |
| 13. Valdez City | 3,313 |
| 14. Petersburg City | 3,178 |
| 15. Barrow City | 3,146 |
| 16. Palmer City | 2,988 |
| 17. Kotzebue City | 2,660 |

Other cities with populations between 1,000 and 2,500 population were: Wrangell (2,416), Dillingham (2,232), Seward (2,463), Cordova (2,048), North Pole (1,610), Unalaska (1,131), Delta Junction (1,185), Haines (1,120), and Craig (1,087).

## Census Designated Places

There were 140 additional unincorporated communities which still qualify as census designated places (CDPs) in 1988. To quelify as a CDP, a place had to have 25 or more persons residing in it at the time of the 1980 census.

Two 1980 CDPs have been dropped from our estimates: Dunbar in Yukon-Koyukuk and Big Horn in Fairbanks North Star Borough. The designation of Dunbar as a CDP in 1980 was a census error and the area called Big Horn is not recognized as a community by Fairbanks North Star Borough government or residents. Since CDPs have no incorporated boundaries, the limit of the settled area is assumed to be definition to be similar to the 1980 census definition. However, if the places have grown since 1980, the boundaries for these places will be assumed to be the currently settled community area. In this way the boundaries for some CDPs may be more like the CDP definition for 1990 than for 1980. The reason for this is that our indicator data is usually for the settled community area and cannot be broken into parts that identify only the area as it existed in 1980. We are continuing to work to improve our ability to track the population of small places.

Alaska has several large CDPs which are bigger than many of the incorporated cities in the state: College (5,317), Eielson Air Force Base (5,217), and Adak Station (4,143) would meet the Census Bureau definition of Urban Places. Several others are estimated to have populations between 1000 and 2,500 population: North Tongass Highway (2,158) (Ketchikan Gateway Borough) and Metlakatla (1,386) (Prince of Wales-Outer Ketchikan Census Area); Sterling (1,602) and Nikiski (1,609) (Kenai Peninsula Borough); Kodiak Station (1,709) (Kodiak Island Borough); Fort Greely (1,520) (Southeast Fairbanks Census Area) and Big Lake (1,049) (Matanuska-Susitna Borough). Such places are ripe for annexation or incorporation.

The Alaska Department of Labor has also identified a substantial number of other small communities which may become CDPs in 1990. Estimates were made in this publication for a number of these communities where the community had a clear identity. Among the larger communities are: Trapper Creek (501), Hobart Bay (142), Chiniak (135), Long Island (130), Whitestone Log (127), Skwentna (114), Nicholevsk (106), Labouchere Bay (88), Edna Bay (78), Chickaloon (75), Chenega Bay (68), Rowan Bay (62), Mt. Betner (56), Guildersleve Float (53), Port Alesworth (48), Polk Inlet (41), Game Creek (38), Alexander (37), Silver Bay Log (36), Beluga River (35), McCarthy (33), Wiseman (30) and Port Protection (23). In addition there are several large suburban areas in Matanuska-Susitna (i.e. Meadow Lakes) and Kenai Boroughs which will qualify as large CDP's. We have not attempted to estimated these here because of the difficulty of clearly defining the area.

## Alaska Native Village Estimates

The Alaska Native Claims Settlement Act identified some 209 Alaska Native Villages (ANV). Populations were reported for these in the 1980 Census. The vast number of these villages are contiguous with cities or CDP's in the state. The estimates presented here are for total population of the ANV and include both Natives and nonnatives who may live in the village. There were a number of small villages with populations to small to be CDP's. We have attempted to estimate populations for these small ANV's in this issue. For these estimates, we have relied upon information provided by native and village corporations, as well as information from the Alaska Permanent Fund and local area postmasters and bush pilots.

CDP – Census Designated Place    ANV – Alaska Native Village

* Designated an acceptable census conducted in accordance with the procedures contained in *"Standards for Conducting a Census in Small Alaska Cities"*.

11/ The recognized boundaries of Nome were smaller in the 1980 U.S. Census than the actual legal boundaries. This was corrected by the Census Bureau in 1981. In 1982, Nome annexed the unincorporated place of "Icy View" which had 210 residents and Perkinsville CDP. The 1980 population of Nome reflects its current boundaries.

CDP – Census Designated Place　　ANV – Alaska Native Village

* A census conducted in accordance with preocedures contained in *Standards for Conducting a Census in Small Alaskan Cities.*

9/ The 1980 U.S. Census incorrectly defined the city boundaries of Kachemak. The Census count included people living outside Kachemak. The 1980 number is an estimate of the 1980 population of Kechemak City in its correct boundaries.

4/ Nunapitchuk and Kasigluk were known collectively as Akolmiut in 1980. Kasigluk was incorporated in 1982. The remaining area changed its name to Nunipitchuk in 1983.

18/ Fortuna Ledge officially changed its name to Marshall in 1984.

CDP – Census Designated Place ANV – Alaska Native Village

* A census conducted in accordance with preocedures contained in *Standards for Conducting a Census in Small Alaskan Cities.*

11/ The recognized boundaries of Nome were smaller in the 1980 U.S. Census than the actual legal boundaries. This was corrected by the Census Bureau in 1981. In 1982 [illegible]me annexed the unincorporated place of "Icy View" which had 210 residents and Perkinsville CDP. The 1980 population of Nome reflects its current boundaries.

4/ Nunapitchuk and Kasigluk were known collectively as Akolmiut in 1980. Kasigluk was incorporated in 1982. The remaining area changed its name to Nunipitchuk in 1983.

# CHAPTER 6

# ESTIMATES METHODOLOGY

## THE NATURE OF ESTIMATES

In preparing these estimates, estimates have been cross checked using as much information from as many different sources as was available. Limitations on staff resources also affects the estimates. Estimates, however, are only as good as the information available to produce them. Data users should always be familiar with the nature of the estimation process and the possible weaknesses of any statistics used.

Estimates of population use indicator information to create what is believed to be the most probable resident population of a place at a given point in time. In fact, no one knows exactly how many people are currently in Alaska, its boroughs and census areas, and places. Nor do we know exactly what the characteristics of these people are. An estimate is an approximation of that number. Each indicator one might select will give one a different estimate. Further, each indicator has some inherent bias that will make it over or under estimate the "true" population at any point in time.

Indicators can be biased in several ways. First, the data being used can simply be inaccurate. Poor quality control on the part of data base managers may produce incomplete statistics or statistics that vary in completeness over time and thus produce distorted trends. Those collecting the data may systematically miss some people through oversight or because people do not wish to be recorded. Some people may be counted more than once.

Secondly, an indicator may not be for the same time or space. Populations change over time, and indicator data are rarely collected at the time being estimated. Sometimes the date of the indicator data may be misleading. For example, 1988 Alaska Permanent Fund information reflects the residence of recipients as of the time they file between April 1 and June 30, 1988. Names of places may also be misleading. The names may be the same, but may not cover the same geographic area. For example, Alaska Permanent Fund (PFD) data does not match 1980 Census definitions for places. Thus the PFD statistics for the city of "Kenai" cover a much larger densely settled area because they are based on zip code areas and this in turn reflects a population substantially larger than that of the Municipality of Kenai.

Thirdly, indicators may not be reflective of the total population. That is, while changes in an indicator may correlate strongly with population change it may not be a perfect predictor. This is because indicators rarely include all persons in a population.

No estimation procedure can be a substitute for a full census population count. Unfortunately, even here there is potential error. The decennial or local censuses and surveys can miss people or count too many people because of a variety of flaws in the enumeration process: poor maps, poorly trained enumerators, lack of follow-up on households which do not respond, double counting of persons at two locations through inaccurate allocation of residency.

Indicator series generated for specific purposes also may be biased. For instance, estimates produced for per capita distribution of money, will frequently have a tendency to be biased upward.

The estimates produced here reflect a several data series, each of which has some type of bias. The averaging of multiple estimates does work statistically to reduce the bias. Where reasonably reliable sets of indicators exist, we have averaged indicators to reduce the error which may be introduced by the use of a single indicator.

## A QUESTION OF RESIDENCE

The time frame for the estimates of resident population produced in this publication is July first of any given year. The July first estimate, however, reflects an average annual resident population. The midyear date serves as the midpoint in the population change in any given year for persons living in their usual place of residence. Our estimates are not intended to be a "de facto" population; that is, a count of all persons in a location on the day July first. The population on this date would be quite a bit above the annual average because of the seasonality of Alaska's population.

By U.S. Census Bureau definition, to be counted as a resident, a person must reside in a place for at least six months of the year and have no other usual place of residence. Residents of remote work sites are given the opportunity to list their place of residence as being somewhere other than the remote site. In 1980, for example, most North Slope oil workers listed their place of residence as being either some other part of Alaska or out of state.

One of the biases in statistics for Alaska involves residency. Employment in the state is highly seasonal in construction, fishing and seafood processing, logging, mining, and tourism. While the exact amount of seasonal population is currently unknown. As indicated earlier, however the number of nonresidents in Alaska may be as high as 4-5% of the resident population of the state and the seasonal midsummer nontourist high population can be as high as 6% of the resident population. In some communities the number of nonresidents or seasonal workers may outnumber the number of permanent residents. The greater the seasonality, the more difficult it is to accurately estimate the permanent residents.

The same jobs that draw seasonal workers to Alaska from outside the state also draw Alaskan workers from one location to another within the state. Sometimes local communities will count transient out-of-state workers and Alaskans from other Alaskan communities as residents when there is money collected on a per capita basis. Since communities frequently provide services for transient populations, they often feel justified in claiming them as residents for revenue

Table 6.1

## ALASKA DEPARTMENT OF LABOR AND U.S. CENSUS BUREAU POPULATION FOR ALASKA, 1980-1989

| Year | Alaska Dept. of Labor Research & Analysis | U.S. Census Bureau | Percent Difference |
|---|---|---|---|
| April 1, 1980 | 416,100 | 401,851 | 3.55 |
| July 1, 1981 | 433,800 | 416,000 | 4.20 |
| July 1, 1982 | 463,400 | 446,000 | 4.02 |
| July 1, 1983 | 497,600 | 482,000 | 3.19 |
| July 1, 1984 | 522,000 | 505,000 | 3.33 |
| July 1, 1985 | 541,300 | 522,000 | 3.78 |
| July 1, 1986 | 547,600 | 531,000 | 3.12 |
| July 1, 1987 | 537,800 | 525,000 | 2.38 |
| July 1, 1988 | 531,000 | 525,000 | 1.30 |
| July 1, 1989 | 543,400 | 527,000 | 1.40 |

sharing purposes. Such populations do not, however, meet Census Bureau definitions for residency. Similarly, a small unknown proportion of the nonresident population will claim or attempt to claim to be residents for the purpose of collecting Permanent Fund Dividends.

## STATE LEVEL METHODOLOGY

The State of Alaska participates with the U.S. Census Bureau in the Federal-State Cooperative for Population Estimates (FSCPE) and subscribes to U.S. Census Bureau definitions and standard demographic methodologies. There has been some disagreement between the U.S. Census Bureau and several Federal-State Cooperative representatives, including Alaska, regarding which of the standard state and county estimates methodologies are most accurate. Testing and discussions are underway to try to resolve these differences.

While nearly all statistics presented in this publication represent estimates generated by the Alaska Department of Labor, some users are required by federal programs to use U.S. Census Bureau statistics in preparing reports, grant proposals, and other documents. For these users, Table 6.1, and Figure 6.1 show federal estimates compared to those of the Alaska Department of Labor. The following section discusses the differences between Census Bureau and Alaska Department of Labor methodology relative to the current round of estimates.

Our current estimates differ from those published by the U.S. Census Bureau in their Series P-26 State Population Estimates. Estimates of the Alaska Department of Labor include a correction for an estimated undercount of approximately 3.6%. This undercount agrees closely with the unpublished post enumeration program estimates of undercount independently produced by the U.S. Census Bureau. The U.S. Census Bureau estimates do not attempt to correct for the level of undercount experienced in different states. The average undercount for the U.S. was 1.0% in 1980.

### Census Bureau Methodology

State estimates as produced by the Census Bureau for the 1980s are currently developed by averaging the results of two methods: an administrative records method and a composite method. The sum of the state estimates is controlled to a national estimate. This means that the sum of the states will equal the national estimate.

The administrative records method is a component procedure for estimating the population under age 65. The estimate is developed by using:

1. the 1980 census counts to calculate the persons under age 65 on the estimate date,
2. adding the births for the period between the base year and the estimate year,
3. subtracting deaths occurring in this period to persons under age 65 on the date of estimation,
4. adding net migration derived from IRS tax return change of address,
5. adding an estimate of immigration from abroad, and
6. the population over age 65 is estimated from Medicare recipients.

The composite method uses different techniques to estimate different age segments of the population. The different age groups are: 0-14, 15-64, and 65+.

In estimating the 0-14 age group, the statistics on Alaska births and U.S. death rates by whites and non-whites are used as well as elementary school enrollment statistics. The population 0-14 years of age for each estimate period was developed by components of change. The age cohorts 0-4 and 5-14 on the estimate date were derived using the 1980 census and birth statistics. To each age group was added an estimate of deaths and an estimate of net migration derived from the relationship of school enrollment to population at the time of the census and the current estimate. Then the assumption was made that at each age 0-4 and 5-14 age cohorts shared equally in the cumulative school-age migration.

In estimating the population in ages 15 to 64, a ratio correlation approach is used. The percent changes in the state distributions of three symptomatic variables from 1980 to the estimate year were used to estimate the percentage changes in each states distribution of the household population 15-64 years of age from 1980 to the estimate year. The estimated state percent change in population was multiplied by Alaska's share of the 1980 U.S. population to yield a preliminary estimate of the Alaska population in the estimate year. The preliminary distribution of all states was then proportionately adjusted to an independent national estimate of the population in the estimate year.

The estimate of the change in a state's share of the national population from 1980 to the estimate year was calculated from a linear regression equation, relating the percent change in the distribution of population (the dependent variable) between 1970 (adjusted for undercount) and 1980, and the percent change in the distribution of three independent variables. These were:

1. school enrollment
2. the number of federal income tax returns filed by persons under 65 years of age, and
3.) an estimate of the number of housing units.

The population over 65 was estimated from the change in Medicare enrollees as it was in the administrative records method.

## ALASKA ESTIMATES MODEL

The model used to produce 1980-88 age/race/sex estimates is a modified cohort component administrative records model. It uses current detailed Alaskan mortality and fertility and detailed patterns of migration produced from 1975-80 place of residence as well as place of birth statistics and current IRS gross migration flows. This is the most recent information available on the age/race/sex composition of migrants.

The basic demographic equation used to generate the Alaska estimates is as follows:

Population P2 = Population P1 + Natural Increase [Births - Deaths] + Net Migration [Out Migration to Alaska - Out Migration from Alaska] Where: P1 = Beginning Population P2 = End Population

The July 1, 1980, base population has been adjusted for estimated undercount. It is carried forward year by year to 1988 by adding known births and deaths derived from Alaska vital statistics. These are provided by the Public Health Division of the Alaska Department of Health and Social Services. These vital statistics are adjusted for missing population characteristics. Migration to and from the state for the estimate period was derived from a combination of 1980

U.S. Census data and U.S. Internal Revenue Service statistics on migration for 1980-1988. For the period 1980-1988, the model migration flows were calibrated using public and private school enrollments for grades 1-8 against the population 6-14 and Medicare data was compared against persons 65+.

Comparisons were also made to the year of birth statistics from the Alaska Permanent Fund. The model predicted the age structure of permanent fund applicants quite well seven years from the base year. The model also allows an estimate of those persons (primarily military and dependents) who were not applicants. While the overall relationship of the age of persons who apply for the permanent fund is reasonably stable from year to year, the overall proportion of Alaska's population applying has varied from year to year. Trends in PFD dividend applicants have tended to be a relatively poor predictor of trends in the state's population growth.

Because of the ability of the model to predict different component age groups well over time, and its administrative records character, it was selected as a suitable replacement for the U.S. Census Bureau average of administrative records and composite methods.

## BOROUGH AND CENSUS AREA METHODS

Census area populations were estimated by averaging the results of two estimating techniques: administrative records and regression. Boroughs conducting full censuses by the approved housing unit method override either of these techniques. The remaining boroughs and census areas are controlled to the state total population.

This procedure is slightly different from that used by the U.S. Census Bureau to produce the current borough and census area estimates. The Census Bureau estimates were computed by an average of two techniques: Ratio Correlation Regression and Component Method II. These Bureau estimates also include estimates for the same boroughs and census areas conducting a full census by the approved Housing Unit Method which overrides both techniques. The Census Bureau borough and census area estimates are controlled to the Census Bureau state estimate. County estimates produced by the U.S. Census Bureau and the Alaska Department of Labor are shown in table 6.2.

Both Alaska and the Census Bureau use the same regression equation in estimating the population for census areas. In the regression method, a multiple regression equation is used to relate changes in the distribution of a number of data series to changes in the distribution of population among areas. For both the development of the regression equation and the computation of the population estimates, the data for all variables are transformed. This transformation involves by calculating ratios of percentage shares in the later year to corresponding percentage shares in the earlier year. The resulting coefficients in the prediction equation therefore approximately add to 1.0. The series of data used in the regression method for Alaska are a dummy variable for major cities (X1), medicare enrollees (X2), school enrollments in grades 1 through 8 (X3), a 3-year average of resident births (X4), and a dummy variable for areas less than 5,000 population (X5). The regression equation for Alaska is given by:

$$Y = 0.207 + 0.055(X1) + 0.046(X2) + 0.408(X3) + 0.297(X4) - 0.032(X5)$$

The U.S. Census Bureau averages Alaska's Ratio Correlation Regression estimates with their Component Method II to produce their provisional 1988 county estimates. Our regressions will also be averaged with the Bureau's Administrative records to produce revised 1987 estimates.

The Alaska Department of Labor's Administrative Records method is essentially the same as the method used by the U.S. Census Bureau for other states except that we do not remove group quarters. Since IRS migration includes military and college movement, it distorts the estimate to apply IRS migration only to the non-group quarters population. This step was necessary when residual net migration rates were used to estimate migration. At the time of the Provisional 1988 estimates, IRS migration for 1986-88 was not available. Change in school enrollment was therefore used to estimate net migration for the 1986-88 provisional Administrative Records estimates.

Component Method II uses reported birth and death statistics to measure net natural increase but relies on school enrollment to measure net migration. The estimates produced by Component Method II are specific to the population under 65 not residing in group quarters. To this population is added an estimate of the population 65 and over. This estimate is based on the change in Medicare enrollees from 1980 to the estimate date, the institutional and college populations, and the reported military populations living in barracks.

## AGE ESTIMATES FOR BOROUGHS AND CENSUS AREAS

Age estimates for boroughs and census areas were generated utilizing sex and date of birth information from the Alaska Permanent Fund for 1988, and independent estimates of Armed Forces and dependent populations for the Aleutian Islands Census Area, Anchorage Borough, Bristol Bay Borough, Fairbanks North Star Borough, Kodiak Island Borough, and Southeast Fairbanks Census Area. Preliminary estimates were controlled to borough and census area populations.

## RACE ESTIMATES FOR BOROUGHS AND CENSUS AREAS

Since current indicators of migration by race do not exist, a mixture of current and historical trend data was used to generate race estimates for labor market regions, boroughs, census areas, and Alaska Native Regional Corporations. In addition, this year the Alaska Department of Education began surveying student race for the first time. The weighted average of three series controlled to state totals were used to produce these estimates. These include: Proportion of native students by place, 1980 constant proportion of Natives in places, and an administrative records estimate using births and deaths and historic migration by race at the census area level.

## METHODS FOR PLACE POPULATION AND HOUSEHOLD ESTIMATES

### Local Census And Surveys

As with the Census Bureau estimates, place estimates are controlled to estimates for census areas and the state. In both the Census Bureau estimates and Alaska Department of Labor estimates there are conditions under which smaller area estimates may override census area estimates. These conditions are met when a boroughwide census has been taken according to the requirements as set by the U.S. Census Bureau and the Demographic Unit of Research and Analysis, Department of Labor. These requirements are that the local census must follow the U.S. Census Bureau procedure for doing full enumerations or Housing Unit Method estimates. Research and Analysis provides training in the census methods and the census must be reviewed by the Alaska Department of Labor.

In addition, the U.S. Census Bureau and the Alaska Department of Labor generally accept full population rosters of small places as acceptable censuses when all households are listed along with all currently resident family members. These household census lists are most likely to be accepted if accompanied by a map showing each village housing unit by number as well as its residents. These censuses are adjusted back to July 1, at a growth rate comparable to their growth since 1980, if they are conducted prior to or after that date. All or part of a local census may be rejected if there is evidence the census includes nonresidents or used a period of residency of less than six months.

Usually sample surveys or local estimates are not accepted without adjustment by the Alaska Department of Labor. The Department may accept all or part of the information from such a survey, if it follows the housing unit method for producing local population estimates and the estimate is corroborated by our independent estimates. Local censuses are also usually adjusted forward or backward to July 1 using the community trend since 1980.

Several indicator series were used to produce estimates for this year. The key statistical series used in preparing these estimates are: Constant Proportion, Education Ratio, Alaska Permanent Fund, Local Census Ratio Estimates, and Public Health Nursing Estimates. This last series because of its incompleteness and inconsistency was rarely used. Instead these data were used in many cases as a reasonableness check on the other estimates series.

The Constant Proportion estimates assume that all communities share the growth of the census area. This technique tends to miss sharp localized change but is quite good in areas where growth is relatively stable and primarily due to natural increase and constant patterns of migration.

Education Ratio estimates use changing enrollment patterns for students in grades 1-8 as an indicator of community change. This technique is weakest where there are few children. It is also weak where there is a population that is heavily adult male and not family oriented such as logging and mining camps, or communities with nonfamily oriented fishing and canning operations. Boroughs with unified school systems such as Fairbanks North Star Borough, Matanuska-Susitna Borough, Bristol Bay Borough, Ketchikan Gateway Borough, and Kenai Peninsula Borough are extremely difficult areas for which to generate Education Ratio estimates. This is because data on residence relative to each school must be obtained from the local school district and students allocated to the appropriate community or rural area.

Estimates generated from Alaska Permanent Fund applications are best for communities that are isolated and where the zip code area is likely to be approximately the same as the community boundaries. This indicator is weakest in densely settled areas such as Kenai Peninsula and Matanuska-Susitna Boroughs and in places where rural routes covering large areas, central rural post office boxes, and multiple community zip codes are in use. For example, the communities of Atka and Attu in the Aleutians share a central Anchorage zip code.

About 23% of the persons who identify themselves as active duty military file for Permanent Fund Dividends and this percentage varies from base to base. [illegible]ther the number of military dependents who identify themselves as residents is unknown. Research would indicate that probably 50-60% of the Air Force and Army active duty military and dependents consider themselves Alaska Residents and file for Permanent Fund dividends. The vast majority of Coast Guard consider themselves permanent residents of Alaska. As a result, raw permanent fund data is weak and requires adjustment of estimated nonfilers in the Anchorage Borough, Fairbanks North Star Borough, Kodiak Island Borough, Aleutian Islands, Southeast Fairbanks Census Area, and Bristol Bay Borough.

## Local Estimates

For the first time, Alaska Department of Labor estimates for places were averaged with estimated produced by the U.S. Census Bureau to produce the Bureau's provisional 1988 place estimates. Such averaging is done for seven other states where estimates prepared by a Federal State Cooperative agency meet the Bureau's estimate standards: California, Florida, Oregon, New Jersey, New Hampshire, Vermont and Wisconsin. The state of Washington's estimates are accepted by the Census Bureau as the official place estimates for the state.

As of July of 1988, Alaska had 151 incorporated municipalities. Eighty nine percent, or 134 of these cities and three boroughs conducted local censuses, acceptable Housing Unit Surveys or had full population count rosters at some time since 1980. In 1988, 37 communities or 25% of municipalities conducted acceptable censuses. Where these existed for an estimate year they overrode any other estimate for that year. For years in which no local census existed, an estimate series based upon either the ratio of local census to education or permanent fund data was created. This series reflects the change since the census in the indicator variables.

Public health nurses annually report population estimates for communities they serve. This program does not cover the whole state and estimates of community populations are not reliable for densely settled areas or large communities. However, in small rural villages these estimates are of value. They were in general considered or used only when no other estimate series were available. Frequently they served as a "reasonableness check" on other estimate series or were used as a third averaged estimate.

As indicated above, each of these indicator series has its own special potential weakness. To minimize these weaknesses, estimates for all places where more than one series was available reflect an average of data from at least two series. In some cases the estimate series selected represents a "judgement call" on the part of our staff. When estimate series gave seriously conflicting results, additional research was undertaken to attempt to ascertain the best estimate series.

Confidence in our estimates for places differs depending on the consistency of data series available for a given community. We continue to work to improve the estimates series as well as expand information for each community.

## Household Estimates

This year we have developed a series of experimental estimates of the number of occupied households for all localities in Alaska as part of our census review activities. No attempt has been made to estimate the number of housing units which may exist in a community, some percentage of which will be vacant.

The methodology was extremely complex and time consuming. It consisted of tallies of number of persons for each unique address in Alaska from the Alaska Permanent Fund. These estimate of households by size were used to generate a number of persons per household for all communities. Adjustment had to be made for the tendency for persons at a unique address to over represent single person households. That is, it is not uncommon for subfamilies or individuals in the same household to maintain separate mailing addresses or boxes. The data also had too be converted from zip code based geography to census based geography.

The resulting estimates were applied to the estimated population of the community to derive an estimate of the number of households. In addition, adjustments had to be made in heavily military areas for military and dependent nonfilers. Like the population estimates, estimates were overridden by local censuses which listed all households. The household estimates were compared to a series based on the 1980 Census number of persons per household applied to the 1988 population for reasonableness. While we are encouraged by the results of our initial tests of this series of estimates against local censuses and surveys and independent Census Bureau estimates of the total number of households for Alaska boroughs and census areas, testing against the 1990 census will be needed to refine the methodology.

If these estimates prove to be inaccurate, they may in some cases continue to overestimate the number of occupied households. We will appreciate any comments on the part of communities regarding the accuracy of these estimates of households as they will aid in the refinement of the methods for the 1989 and subsequent rounds of estimates.

# GLOSSARY

**Average annual rate of change** - a standardized statistical measure of the rate of change which can be compared for any number of years because it converts the change for any period to an yearly measure.

**Cohorts** - a group of persons who experience the same event or series of events in a particular period. For example all persons born in a particular year or all couples married in a particular year would be considered cohorts of that year.

**De facto and de jure counts** - In a census the enumeration is affected by the type of population count to be obtained. The census may be designed to count persons where they are found on census day (a de facto count) or according to their usual place of residence (a de jure count). The U.S. Census is a de jure count. Only transients who have no usual place of residence are counted on a de facto basis.

**Dependency Ratio** - the proportion of the population dependent on the adult population. For youth dependent the under 18 population is divided by the age group between 18 and 65. For elderly dependent the population over 64 is divided by the age group between 18 and 65.

**Fertility** - the childbearing performance of individuals, couples, groups or populations. Sometimes measured as the number of live births per 100 people in a given year or as the number of children born to women of a particular child bearing age.

**Median age** - The age which divides a population into two numerically equal groups; that is, half the people are younger than this age and half are older.

**Gross migration** - The sum of the in-migration and out-migration for a geographic area over time. Gross migration is a measure of the total movement or turnover of population. Gross migration is of most interest to persons needing information on population turnover rather than overall gain or loss. Such as the real estate and transportation industries.

**Group Quarters** - are living quarters shared by ten or more unrelated persons.

**Household** - a housing unit occupied by a family or fewer than 10 unrelated individuals.

**In-migrant** - a person who enters an area from some point outside the area for the purpose of establishing a permanent residence. The person may come from another nation, state, or county.

**Migration** - The movement of people across a specified boundary to establish a new permanent residence. Movement between countries, states or counties is considered migration, movement with a county is considered as "local movement".

**Mortality** - Death as a component of population change. Usually measured as the number of deaths per 1000 people in a given year.

**Natural increase** - the difference between the number of births and the number of deaths in a given period, usually a year.

**Net-migration** - the difference between in-migration and out-migration. It is called net in-migration if there are more persons moving into the area than out. It is called net out-migration if there are more persons leaving the area than coming in.

**Out-migrant** - a person who leaves an area for some point outside the area for the purpose of establishing a permanent residence. The person may go to another nation, state, or country.

**Population estimate** - a computation of the probable population of a geographic area for a particular time. An estimate is usually done for a past time period for which indicator data already exists.

**Population projection** - a computed future population number based on methodology which trends known historical data.

**Resident** - a person who lives in Alaska at least six months of the year and/or has no other usual place of residence elsewhere.

**Sex Ratio** - the number of males per 100 females.

**ERRATA** **ERRATA** **ERRATA**

## ALASKA POPULATION OVERVIEW, 1988 AND PROVISIONAL 1989 ESTIMATES

In reviewing the most recent Overview, we found several errors we would like to bring to your attention. We regret any inconvenience or misunderstanding these errors may have caused. You may wish to write in the corrections. They are as follows:

Page 10, 8th bullet and page 38, paragraph 1, under Sex Composition should read:

> **In 1989, 48.2% of Alaska's population, or 257,504 persons were female compared to 51.2% female for the U.S. as a whole.**

Page 10, 10th bullet should read:

> **In 1988, Alaska had 0.9 persons per square mile.**

Page 10, 11th bullet and paragraph 2, line 1 on page 42 should read:

> **In 1988, 222,950 or 41.7% of Alaska's population lived in the Municipality of Anchorage.**

Page 22, Table 2.5 the 1939 Native Population should read: **32,458**.

Page 23, Table 2.6 the line for Native Americans should total: **64,103**.

Page 24, paragraph 4, line 10 should read:

> **The net loss due to migration was about 3%.**

Page 37, paragraph 4, line 5 should read:

> **For instance, as shown in Table 2.10**

Page 38, footnote 1 should read:

> **An average annual rate of change is a standardized statistical measure of the rate of change which can be compared for any number of years because it converts the change for any period to a yearly measure.**

Page 42, paragraph 2, line 6 should read:

> **These contained 74.1% of Alaska's population in 1988.**

Page 68, paragraph 1, line 2 should read:

> **These estimates are shown in Table 4.2 and Table 4.3.**

Page 68, paragraph 2, line 4 should read:

> **are shown in Table 4.4. The boundaries ....**

Table 4.5 is not referenced in the text.

# ALASKA POPULATION OVERVIEW

## PREFACE

*Alaska Population Overview* provides frequently requested population information in one publication. This publication presents the resident population of Alaska under the same concepts and definitions used by the U.S. Bureau of the Census for the 1990 decennial census of Alaska. Population fluctuates throughout the year. Because of this fluctuation, the July 1 population presented here represents an average population for the year rather than the population on July first.

All 1990 census population counts presented in this publication are subject to possible correction for undercount or overcount. The U.S. Department of Commerce is considering whether to correct these counts and will publish corrected counts, if any, not later than July 15, 1991.

This edition of *Alaska Population Overview* includes four chapters which cover current and historical population estimates for the state, boroughs and census areas, special areas, and places. A description of specialized terms is in the glossary at the end of this publication. Population projections for the state appear in *Alaska Population Projections*. First published in 1986, the second edition is scheduled for July 1991.

In addition, specific information on life expectancy by age, race and sex for Alaska can be found in *Alaska Life Tables for 1977-83*, Demographic Report No. 1, Alaska Department of Labor, Research and Analysis, 1986.

The statistics which appear in this issue of *Alaska Population Overview* supersede figures which appeared in earlier issues, due to changes in methodology and the updating of estimates. Because of these revisions, it is recommended that any trend data be computed from this edition of *Alaska Population Overview* rather than a combination of past editions.

Where estimates occur in this publication they are published in unrounded form for ease of use in other computations, the reader should not assume that any estimates are accurate to the last place. In general, the State estimate is assumed to be accurate to the nearest thousand and borough and census area estimates to the nearest hundred.

Special acknowledgment is given to the Vital Statistics and Nursing sections of the Alaska Department of Health and Social Services, Public Health Division; the Alaska Department of Education and the Alaska Departments of Revenue and Community and Regional Affairs for their aid in regularly providing information used in the estimates program.

In addition, the Department of Labor wishes to thank the numerous individuals in city and borough governments and small communities who regularly provide information relative to the estimates program. The Department of Labor thanks personnel departments of the Army, Air Force, Navy, and Coast Guard in Alaska for the statistics they provide each year to the Department of Labor.

Comments or suggestions regarding the content or format of this publication are welcome. General requests for demographic information should be addressed to Greg Williams. The telephone number for the Demographics Unit is (907) 465-4500. Address questions regarding the 1990 census to the State Data Center at the same number.

# ALASKA
# POPULATION OVERVIEW
## EXECUTIVE SUMMARY

The 1990 census count for Alaska's resident population was 550,043 or 0.22% of the population of the U.S. (248,709,873). Only Wyoming, with a population of 453,588, was smaller. The next largest state, Vermont, had a 1990 population of 562,758.

Land area in Alaska covered 570,374 square miles, and water area covered 86,051 square miles. Alaska had almost one-sixth of the land area of the U.S. and slightly over one-third of the water area. Alaska averaged 0.96 persons per square mile in 1990, whereas the U.S. averaged 70.33 persons.

A significant portion of Alaska's 1990 population (almost seven out of ten people) lived in urban areas, places of 2,500 persons or more. In 1990, 226,338 persons, or 41.1% of Alaska's population lived in the Municipality of Anchorage. Anchorage was the 69th largest city in America in 1990 compared to 78th in 1980. Almost three-quarters of Alaska's population was concentrated in the five largest boroughs or census areas, which included Anchorage Borough, Fairbanks North Star Borough (77,720), Kenai Peninsula Borough (40,802), Matanuska-Susitna Borough (39,683), and Juneau Borough (26,751). The Matanuska-Susitna Borough was the fastest growing area during the past decade, increasing by 122.7% from 17,816 in 1980 to 39,683 in 1990.

A total of 247,986 square miles (61%) of the land and 45,351 square miles of the water in Alaska lies outside of any incorporated city or borough. At the time of the census, 24,547 persons or 4.5% of the population of Alaska lived in these unorganized territories.

Natives were mostly concentrated (56.1%) in rural places, with 46.2% living in rural places below 1,000 persons and only 43.9% urban. In contrast, Whites were predominately urban (72.4%). High urban concentration was also shown by both Blacks (92.7%) and Asian and Pacific Islanders (89.1%), with most Blacks (64.8%) and Asian and Pacific Islanders (55.3%) living in Anchorage.

More Alaska Natives now live in Anchorage (14,569) than in any other borough or census area. Bethel Census Area which had the largest number of Alaska Natives in 1980 dropped to second place with 11,370. The greatest increase occurred in the Anchorage/Matanuska-Susitna region which contained 15.0% of the Alaska Natives in 1980 and 19.3% in 1990. Most of the growth in Alaska Native population was due to natural increase (births minus deaths).

The White population accounted for 415,492 persons or 75.5% of the population in 1990. The other races were accounted as follows: Native (85,698 or 15.6%), Black (22,451 or 4.1%), Asian and Pacific Islanders (19,728 or 3.6%) and Others (6,674 or 1.2%).

In April of 1990, 260,176 persons, or 47.3% of Alaska's population, were female compared to 51.2% female for the United States in 1989. Males totaled 289,867, thus yielding a state male-female sex ratio of 111 men to every 100 females. This differs significantly from the U.S. sex ratio of only 95 men to 100 females. The main sources of distortion for the sex ratio in the state are the presence of military installations, logging, fishing, and mining operations.

The population in Alaska is younger than the national average. Further, the Alaska Native population is much younger than the White population because of its high fertility rate. The 1989 median age in the United States was 31.5 for males and 33.8 for females. The 1990 median age for males in Alaska was 28.5 and the median age for females was 28.4 years. Almost 40% of the population was age 25 to 44 years old. Only 4.1% of the population was over 65, while those under 18 accounted for 31.0%.

Alaska's fertility rate has always been well above the national average. In 1990, Alaska had one of the higher levels of fertility of any state with 2.6 children per family. Utah has had the highest fertility, averaging 2.6 children per family. Between July 1, 1989 and July 1, 1990, 11,695 persons were born in Alaska and 2,110 persons died, a net natural increase of 9,585 persons. This translated into a growth of 1.8% per year as a result of natural increase. Births each year were equivalent to about 2.1% of the beginning population. Approximately 0.4% of the population in Alaska died each year.

In 1990, 226,701 persons or 56.6% of the population 15 and over were currently married and not separated. The currently married declined from 58.1% in 1980. The largest increase was in persons currently divorced. In 1990, 44,541 persons or 11.1% of all persons 15 and older were currently divorced, up from only 8.5% in 1980. The number of persons currently divorced increased 78.6%, twice as fast as the growth of the state's population. The statistics on changing marital status, along with the increasing proportion of persons living alone confirm the continuing decline in traditional families in Alaska and the U.S.

The role of Armed Forces' population in Alaska has always been significant in the state's population and population growth. Currently, the overall Armed Forces' population of Alaska is relatively stable, and accounts for 10.5% (including dependents) of the state's population. The largest number of military and dependents on bases in Alaska were found at Elmendorf AFB and Ft. Richardson in Anchorage Borough (27,486), Eielson AFB and Ft. Wainwright in Fairbanks North Star Borough (18,795), Adak Naval Station in Aleutians West Census Area (5,034), Kodiak Coast Guard Station in Kodiak Island Borough (2,435) and Ft. Greely in Southeast Fairbanks Census Area (1,157).

During the next few years, population change will continue to be strongly influenced by births. Alaska has one of the highest rates of natural increase in the nation. This provides a strong force for growth within the state even in periods of net out-migration. The positive economic growth expected in the early nineties should contribute to a period of net in-migration to the state which, when combined with the natural increase, should create fairly strong population growth at least for the short term.

# CHAPTER 1

# ALASKA STATE POPULATION

## Introduction

This chapter discusses population trends for Alaska. It contains a section on the components of population change which includes births, deaths, and migration. There is a discussion of the age/sex and race composition of the state.

## 1990 Census Results

The U.S. Census population for Alaska, even though it has an April 1, 1990 date, was conducted over a period of months, beginning in February and ending in May.

The U.S. Census Bureau defines a resident as a person who resides in a place for at least six months of the year and has no other usual place of residence. Residents of remote work sites are given the opportunity to list their place of residence as being somewhere other than the remote site. In 1980 and 1990, for example, most North Slope oil workers listed their place of residence as in some other part of Alaska or out-of-state.

Foreign nationals who were resident aliens were counted in the U.S. communities in which they resided. Persons enumerated at work sites, such as the North Slope or fish processing or logging camps, were given a form that allowed them to indicate their usual place of residence if it was different from the place in which they were being counted. Since these were special census forms, it is uncertain whether clear instructions on completing the form were given at all such sites in 1990.

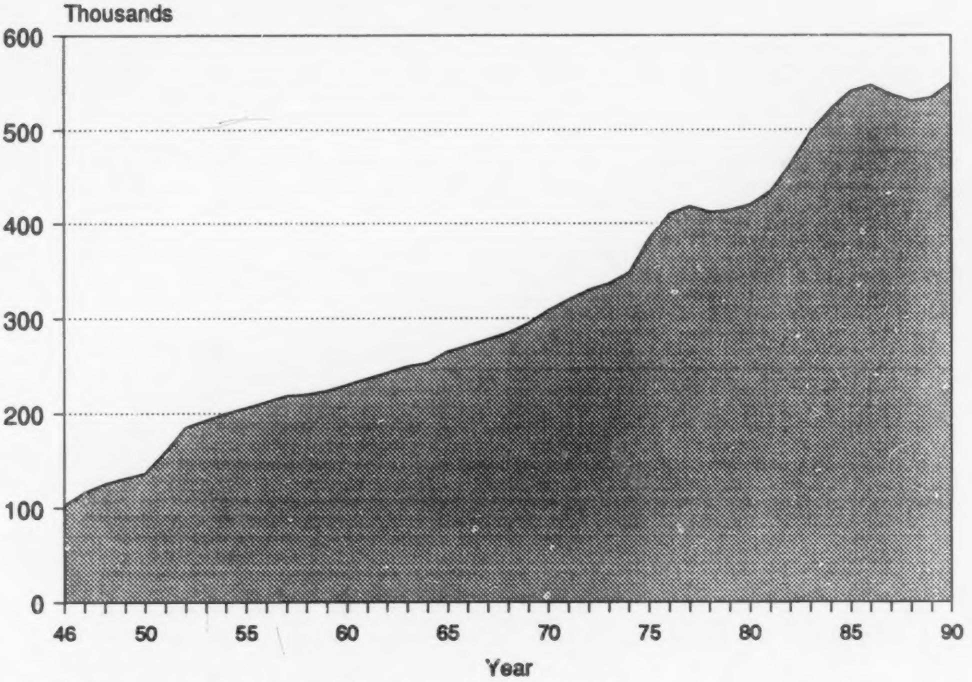
Data on age, sex, and race composition for the state, census areas, boroughs, and places is currently available for 1990. Summary Tape File 1A containing age, race and sex and housing and household data for geography down to the block group level was released at the end of April. The data are too extensive to report here and will not be available in published form from the U.S. Census Bureau until late summer/early fall 1991. This publication only briefly covers age/race/sex data because of time and space limitations.

Detailed age/race/sex information will appear in *Alaska Population Projections* scheduled for release in August. Detailed 1990 census results for voting districts, census areas and places were released in spring 1991 as part of the Public Law data (PL94-171) used for redistricting. These counts of persons and houses are extremely detailed and cover every block in Alaska. Release of social and economic data is expected in late 1991 or early 1992. Inquiries may be made of the State Data Center unit or the Demographics unit of the Department of Labor, Research & Analysis regarding availability of tables from these tapes.

This issue of *Alaska Population Overview* differs from past issues because it primarily includes census information rather than estimates. The Demographics unit will be testing the accuracy of the estimates methods and indicators used during the 1980s against the 1990 census

Figure 1.1

ALASKA POPULATION TRENDS 1946-1990



Source: Alaska Department of Labor, Research & Analysis, Demographics Unit.

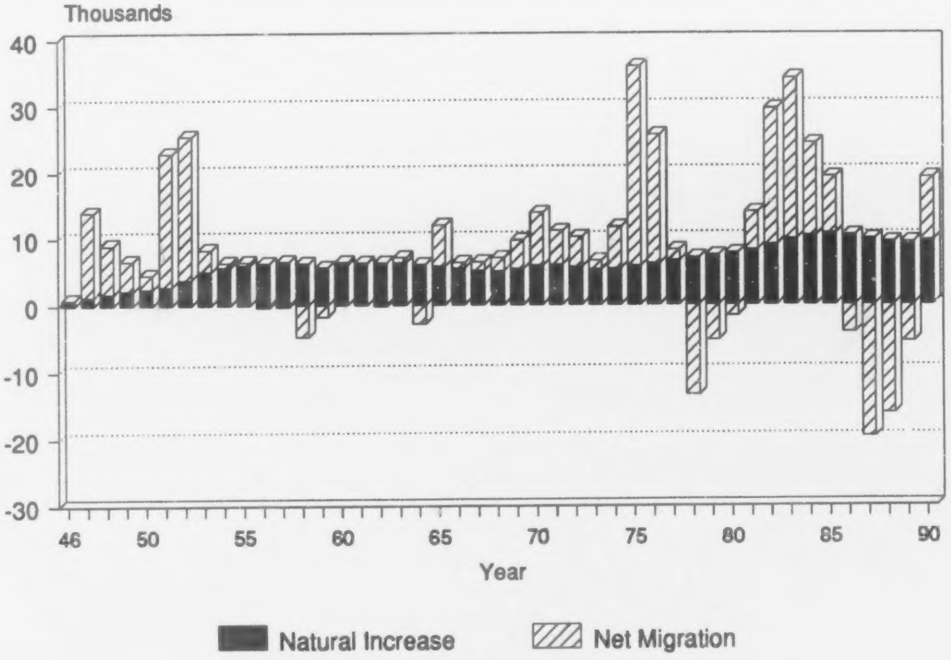
counts. The results of these tests will be used to select methods to use during the 1990s. These results will be summarized in the next *Alaska Population Overview* and presented in detail in a special demographic report series.

No estimation procedure can substitute for a full census population count. Unfortunately, even a census may contain errors. A census can miss people or count too many people because of flaws in the enumeration process such as poor maps, poorly trained enumerators, lack of follow-up on households which do not respond, and double counting of persons at two locations through inaccurate allocation of residency. In addition, the census can be flawed by the refusal of people to respond.

Every census is subject to a small undercount. Nationwide the undercount in 1980 was estimated at 1.0%. In 1980, Alaska's census was among the worst in the country with an estimated 3.6% undercount. The undercount in Alaska for the 1990 census is about 2.0%. The 1990 census counts for Alaska are substantially better than the 1980 counts.

It appears that the 1990 census counted more persons as Alaska residents in fish processing and logging activity than were captured in 1980. Also the 1990 census allocated crews of commercial ships and naval and Coast Guard vessels in port to the harbor they were in when the census was taken. U.S. ships in U.S. waters with a given port as their origin or destination were counted as population of that port. Ships' crews were counted as group quarters population. Persons living on board small craft were counted the same as persons living in houses or apartments. Crews of small fishing vessels were counted at their shore based homes. Because the 1990

Figure 1.2
ALASKA COMPONENTS OF GROWTH 1946-1990



Source: Alaska Department of Labor, Research & Analysis, Demographics Unit.

census created census block numbering areas and tracts for all of the U.S., it is now possible to identify commercial ships in port populations for any port. In 1980, these populations could only be identified for Anchorage, Juneau and Cordova. It is not yet certain, but it appears that these populations represent Coast Guard vessels and floating processor ships or other transient vessels or ships outward or inward bound to a given port.

Such vessels accounted for 2,066 persons in the 1990 census in Alaska or 0.4% of the state's population. In the Aleutians West Census Area, however, these vessels accounted for 11.2% of the population count; in the Aleutians East Borough, 7.6%; Kodiak Island Borough 3.1% and in Valdez-Cordova Census Area 2.9%. At the community level, these vessels had an even larger impact. These crews accounted for 31.7% of the population of Unalaska, 31.7% of the population of Akutan, 13.1% of the population of Kodiak Station, 10.4% of the population of St. Paul, 5.6% of the population of Valdez, 2.9% of the population of Cordova, 2.2% of the population of the City of Kodiak, and 1.4% of the population of Homer.

## Population Trends

The 1990 census count for Alaska's resident population was 550,043 or 0.22% of the population of the U.S. The United States' population, including Armed Forces overseas, was 249,632,692 for April 1, 1990. The resident population of the United States, excluding territories and military overseas, was 248,709,873. Counting the District of Columbia, there were 51 "states" for population purposes. Despite its large size, Alaska was one of the smallest states by population. Only Wyoming, whose population was 453,588, was smaller. The next largest state, Vermont, had a 1990 population of 562,758.

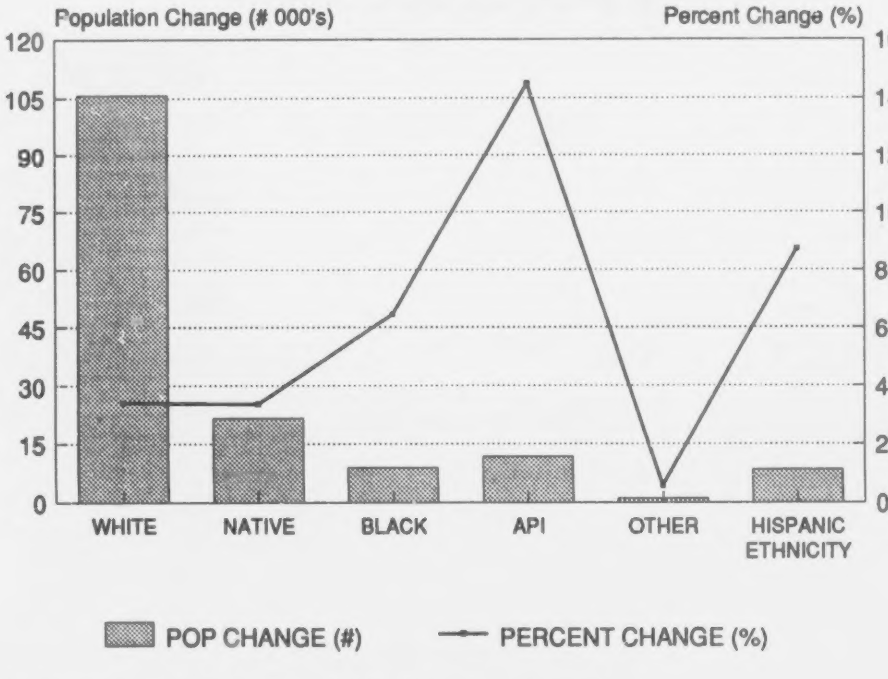
Land area in Alaska covered 570,374 square miles, water area covered 86,051 square miles. Alaska had 16.1% of the land area of the U.S. and 34.3% of the water area. Alaska was about 70% urban, which meant that a significant portion of its population lived in places of 2,500 persons or more. Alaska averaged 0.96 persons per square mile in 1990, whereas the U.S. averaged 70.33 persons. Excluding Anchorage, which contained 41% of the state's population but only 0.30% of the land area, Alaska averaged 0.57 persons per square mile. Most Alaskans live in towns and villages or clustered settlements. Much of the state remains almost uninhabited or tied up in national parks, wildlife and wilderness preserves. Population densities for boroughs and census areas and places are shown in Table 4.3.

The population of Alaska was quite small before the gold rush in the 1880s. The early territorial censuses were incomplete. The first census in 1880 showed 33,426 persons. The gold rush doubled the state's population between 1890 and 1900. After the turn of the century, the population of Alaska remained stable for the next 40 years. The 1900 population was reported at 63,592 and by 1939 the population was only 59,278.

World War II brought the construction of the Alcan Highway. The result was dramatic growth of the state's population as shown in Table 1.1 and Figure 1.1. Although the proportion has declined since World War II, the military continues to play a substantial role in the state. Ten percent of the population is still military and their dependents. The military, historically, have played a key role in the development of both Anchorage and Fairbanks.

Figure 1.3

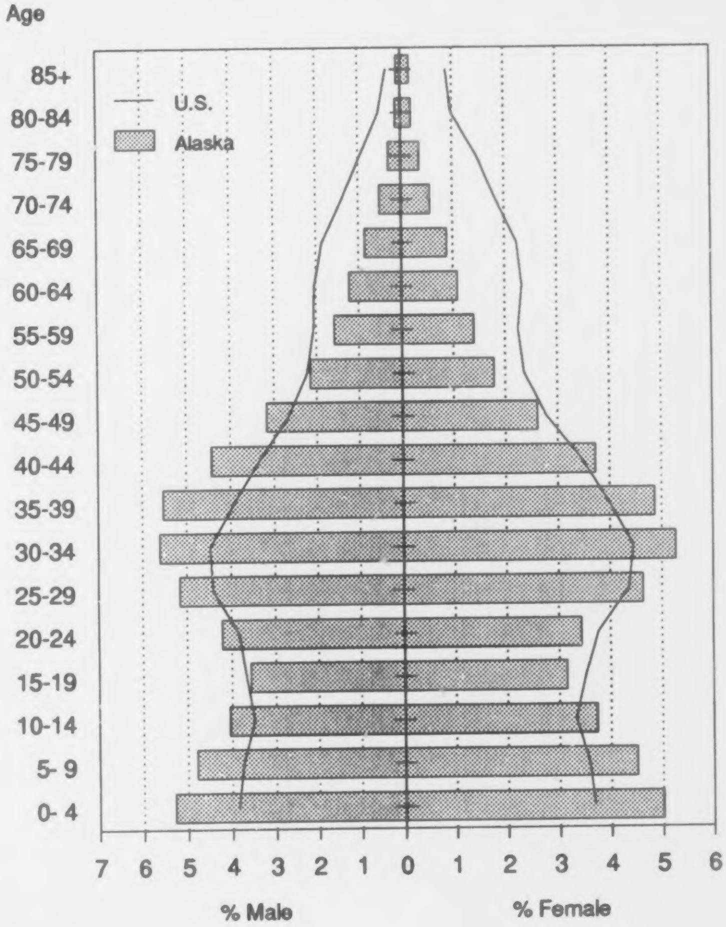
**STATEWIDE CHANGE IN RACIAL AND ETHNIC COMPOSITION 1980-1990**



Source: Alaska Department of Labor, Research & Analysis, Demographics Unit.

Figure 1.4

**ALASKA AND U.S. POPULATION PERCENT DISTRIBUTION BY AGE AND SEX, 1990**



Source: Alaska Department of Labor, Research & Analysis, Demographics Unit.

Alaska's population grew rapidly from the end of World War II to 1952 at an average annual rate of change of 9.5% per year. The population grew at a slower, smoother pace from 1952 to 1965 with an average annual rate of change of 2.7% per year. Alaska had approximately 224,000 people at the time of statehood in 1959. From 1965 to 1973 population growth gradually increased, to 3.0% per year.

The oil pipeline's effect on population growth began in 1973 and peaked in 1975. The average annual rate of change during this period was 6.6% per year. The completion of the pipeline construction boom was followed by a recession during the 1976-80 period. Alaska had a population loss of about 6,400 people between 1977 and 1978. The net loss of people as a result of migration in that year was over 13,400 persons.

Figure 1.5

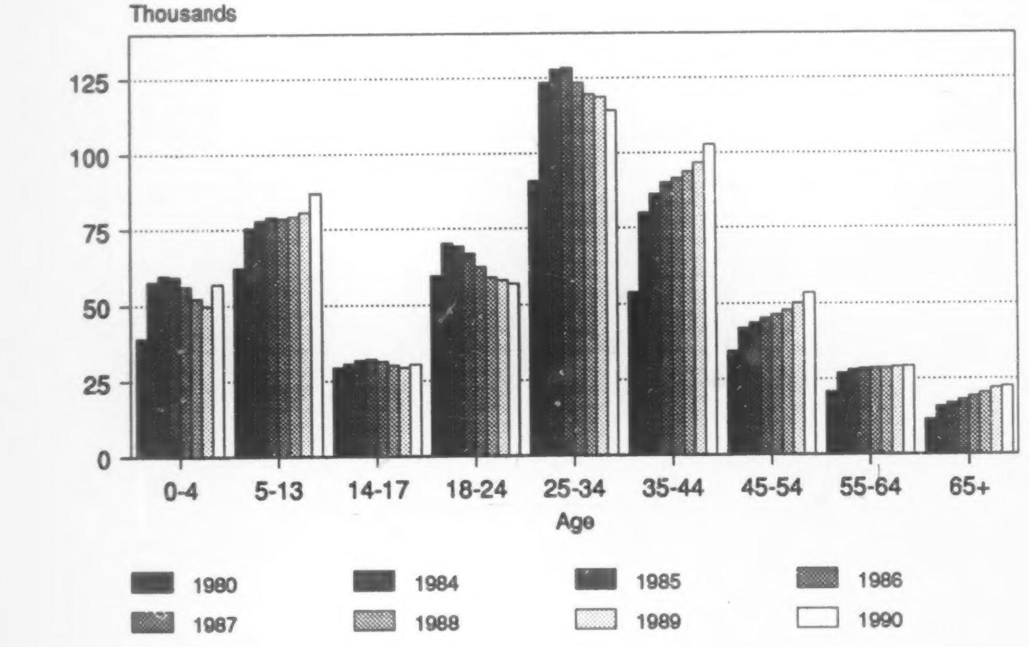
SELECTED YEARS, 1980-1990



Source: Alaska Department of Labor, Research & Analysis, Demographics Unit.

However, the annual rate of change over the four year period, averaged 0.6% per year.

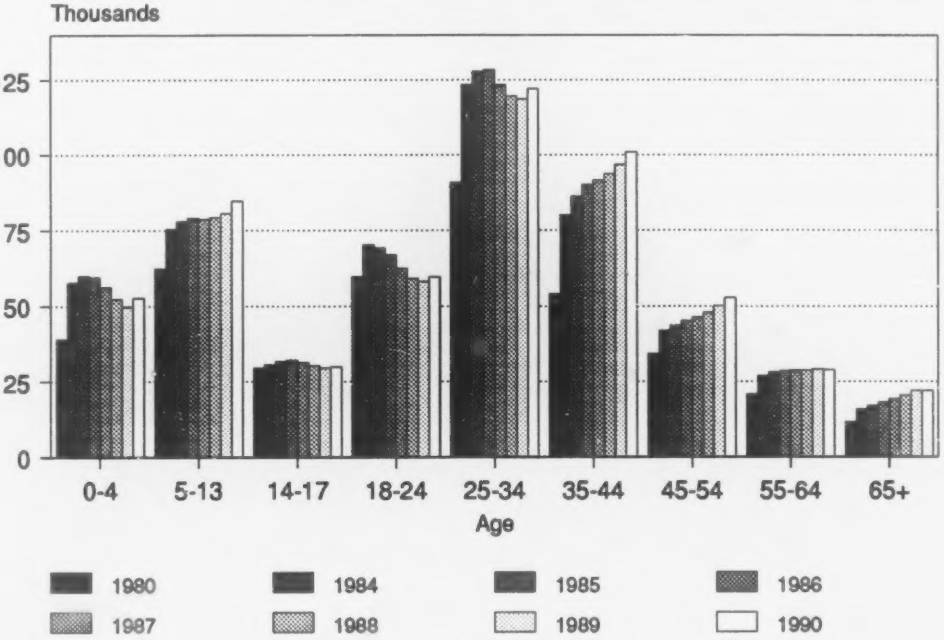
Between mid-1980 and mid-1985, Alaska experienced another boom. This economic growth resulted from construction and infrastructure development fueled by a combination of state spending based on oil revenues, major federal expenditures, and private development. As a result, Alaska's population grew by a phenomenal 25% in five years, making it the most rapidly growing state in the nation. The most growth occurred in the 1981-1983 period during which the annual rate of change averaged 6.8% per year. The pace of growth began to slow during 1983-84 with a rate of change of 4.8% and declined further in 1984-85 to 3.6%.

From 1985-89, Alaska experienced a recession similar to that of 1977-80 but more severe. During the period of most severe retrenchment in 1986-87, the rate of population change declined to -1.8%. The cumulative loss of persons to out-migration in the period 1985-89 was about 45,900 persons as compared to an out-migration of 20,400 during the post-pipeline period. This population loss was equal to about 8.3% of the state's peak 1986 population. This is a greater proportional loss than the loss of Spokane, Washington relative to Washington's total population or the loss of San Diego metropolitan statistical area relative to California's total population. By 1989, net out-migration slowed enough to allow the natural increase of births over deaths to produce the first increase in population since 1986.

A positive increase through net migration gain was achieved for the first time in five years in 1989-90. Migration increases even surpassed the natural increase, an event

Figure 1.6

ALASKA POPULATION BY AGE
PERCENT DISTRIBUTION, SELECTED YEARS, 1980-1990



Source: Alaska Department of Labor, Research & Analysis, Demographics Unit.

that had not occurred since 1984. Growth increased during 1989-90 to the 1985 level at a rate of change of 3.6%. The net migration shown in Table 1.1, however, reflects both real migration and "error of closure" between the estimates series of the 1980s and the 1990 census. An adjusted intercensal smooth series between 1980 and 1990 cannot be created until it is determined what part of the change between 1989 and 1990 is produced by each of these factors. The average annual rate of population change for Alaska during the July 1, 1980 to July 1, 1990 period was 2.8% per year; whereas the change for the U.S. was only 0.9% per year.

Population change should continue to be strongly influenced by births in coming years. Alaska continues to have one of the highest rates of natural increase (births minus deaths) in the nation. This provides a strong force for growth within the state even in periods of net out-migration. The positive economic growth expected in the early nineties should contribute to a period of net in-migration to the state which, when combined with the natural increase, should create fairly strong population growth at least for the short term. As in the past, such growth may not continue unabated.

The prosperity of Alaska remains heavily dependent upon the demand for her natural resources both at home and abroad. Government spending and policy restrictions set by both the federal and state government will also affect population growth in Alaska. Cutbacks in spending at the federal, state and local government (including military) can dramatically affect the prosperity and growth of the state since about thirty-eight percent of the Alaska's labor force is directly employed by one of these levels of government. The

proportion of all income is even higher, since wages are higher than the state average among government workers. Undoubtedly, Alaska like most western states will continue to have a boom-bust economy for many years to come. Alaska's population has increased over fivefold since 1946. Despite fluctuations in population growth in Alaska, the overall trend during the post-World War II period has been towards strong positive growth.

The physical resources of this state will continue to be unique. Demand to exploit Alaskan minerals such as oil, gold, and coal remains strong. Fishing and forestry will continue to play a role in Alaska's future. Tourism continues to result in demands for increased access to the scenic beauty of the state. Beyond the economic considerations, the intangible resource of Alaska as a place of wilderness, beauty, and special way of life will continue to attract migrants to the last frontier.

## Components of Change

Population change is made up of natural increase (births minus deaths) and migration as shown in Table 1.1 and Figure 1.2. For the most part, natural increase is the fairly stable component of population change. Death rates change very slowly, and while current fertility depends on a variety of factors, the general birth trend does not change direction quickly. Migration is the most unstable component of population change in the state, often changing dramatically from one year to the next.

### Births and Deaths

Nationwide fertility rates declined from the 1970s to mid 1980s. In the latter 1980s, this trend reversed. From a nationwide low in 1987 of 1.8 children per family, fertility increased to a 1990 high of 2.1 children per family. This increase was primarily the result of increased fertility for older baby boom women who postponed marriage and childbearing. Alaska's fertility rate has always been well above the national average. In 1990, Alaska had one of the higher levels of fertility of any state with 2.6 children per family. Utah has had the highest fertility, averaging 2.6 children per family. Decade trends in crude birth rates for Alaska, its boroughs and census areas can be seen in Table 2.4. For

Source: 1980 and 1990 Census of Population & Housing and special U.S. Census tabulations.

most areas of the state, current birth rates were only slightly lower than those seen nationwide during the baby boom of the 1950s.

Between July 1, 1989 and July 1, 1990, 11,695 persons were born in Alaska and 2,110 persons died, a net natural increase of 9,585 persons. This translated into a growth of 1.8% per year as a result of natural increase. Births each year were equivalent to about 2.1% of the beginning population. Approximately 0.4% of the population in Alaska died each year.

Most of the growth in Alaska Native population was due to natural increase. Birth rates among Alaska Natives were very high. In 1990, the crude birth rate for Alaska Natives was 32.8 per 1,000 and the crude death rate was 6.2 per 1,000 for a natural increase of 2.6% per year. For Alaska Natives, the average number of children was about 3.9. In 1970, the average number of children for Alaska Native families was 4.6. The number declined to a low of 2.7 in 1976, and has slowly risen each year since.

In contrast, the crude birth rate for White Alaskans was 19.2 per 1,000 and the crude death rate was 3.6 per 1,000 for a natural increase of 1.6%. For White Alaskans, the average number of children was about 2.4 in 1990. The size of White families in Alaska has been relatively stable since the mid 1970s.

## Migration To/From Alaska

As seen in Figure 1.2, migration to Alaska has varied widely from year to year. As a result, it is difficult to identify typical patterns of migration for the state. Rapid growth occurred during World War II represented by a 12.3% rate of proportional growth due to migration for 1945-46. The highest post-World War II proportional growth due to migration occurred during the build up for the Korean War in 1950-51 (14.7%) and 1951-52 (13.6%). In part, these high percentages resulted from the small population base in these years. While the net migration for 1981-82 and 1982-83 was numerically larger than that for 1950-51 and 1951-52, it was proportionally much smaller. By 1983, the net influx of 24,300 migrants accounted for only a 5.3% increase in the population.

The largest single numerical increase due to migration (30,222 or 8.7%), occurred during pipeline construction in 1974-75. The largest numerical loss (-19,645 or -3.6%), occurred in 1986-87, and was larger than the -13,414 or -3.2% loss, which occurred at the end of the pipeline construction in 1977-78.

Historically, the majority of growth from migration in the U.S. occurs in relatively few of the 3,139 counties. Most communities in the U.S. attract relatively few migrants each year. Because the late teens and twenties are the ages of highest migration, most communities provide a pool of young migrants who usually leave the communities of their birth to find better opportunities elsewhere.

Migration statistics are derived from change of address on Internal Revenue Service (IRS) tax returns. Alaska tends to have among the highest levels of in, out and gross migration of any state in the union. During 1987-88, 50,103 or 9.2% of Alaska residents left the state and some 33,909 persons or a number equal to 6.2% of Alaska's residents entered the state. The net loss due to migration was about 3.0%. These migration rates include rotation of military personnel in and out of the state. The military probably accounts for about 20% of the in, out and gross migration flow of the state each year.

IRS migration statistics for 1988-89 and 1989-90 were not available for this publication. The residual net migration for 1989-90 may not be accurate because it currently includes both migration and the error of closure. The error of closure is the difference between the estimate of population for April 1, 1990 and the April 1, 1990 census count of population. Since April 1, 1990 estimates of population cannot be completed without the 1988-90 IRS migration statistics, no attempt has been made to develop a smooth series for the 1980s that accurately reflects the migration for the 1989-90 period. The 1989-90 net migration will be somewhat less than the 9,615 shown, perhaps about 6,000-7,000. Readers should be aware of the discontinuity in the data series and Tables 1.1 and 1.2.

The highest turnover is for persons in their twenties and children under 5. Sta-

Source: Alaska Department of Labor, Research & Analysis, Demographics Unit.

tistically the average length of stay for a 21 year old in Alaska is 9.9 years for males and 13.6 years for females. This means that of a group of Alaska men currently age 21, 50% can be expected to leave the state by the age of 31.

Another characteristic of migration is that people tend to move short rather than long distances. These moves also tend to be in the form of streams and counter-streams. This means states that contribute more migrants in times of prosperity in Alaska are the same ones to which migrants return when the Alaskan economy falters.

Migration to and from the state is in part dependent upon federal military and program policies which tend to be unique historical events rather than easily predicted trends. The overall economies of the Pacific and Mountain regions relative to that of Alaska also helps to drive migration in this state. Thus when employment in Washington, California and Oregon becomes relatively weak, there is a greater tendency to look to Alaska for opportunity.

As shown in Table 1.2, changes in migration to/from Alaska are more a result of the decline in in-migrants to Alaska than changes in the out-migrants from Alaska. A net loss or gain results from an increase or decrease in the in-migrants relative to out-migrants. The higher the rate of gross migration or turnover, the more unstable the population is. Thus one cannot always tell by observing what appears to be a net gain or loss of population whether changes in in-migration or out-migration are the cause of the change. What appears as massive out-migration may be a normal 10% out-migration with a sharp decline in in-migrants to the state.

Most of the fluctuation in migrants during the 1980s is accounted for by non-Native migration to/from the state. While there has historically been a relatively large migration flow of Alaska Natives to and from the state each year, the flows have been fairly balanced. The net effect has produced an almost negligible gain or loss of Alaska Natives each year due to migration.

Population in Alaska is also very subject to seasonal fluctuations. While the exact amount of seasonal population is currently unknown, an estimate of the annual average number of nonresident workers present in Alaska based on quarterly statistics is about 23,800 for 1988. The seasonal high quarter which occurs during the summer months, would add another 8,400 nonresident workers over the annual quarterly average. While the number of dependents per nonresident worker is unknown, one might assume that seasonal workers in Alaska would tend to bring few dependents with them. It is possible, therefore, that the nonresident population in the state at any given point in time may be equal to about 4-5% of the state's resident population. The midsummer de facto nontourist, nonresident population may be about 6% of the resident population.

## Population Composition

### Race Composition

Throughout most of Alaska's history, little reliable data has been available on Alaska Natives. This was particularly true before the 1929 Territorial Census. In 1929, there were some 29,983 Alaska Natives in Alaska and they made up 50.6% of the state's population. While their numbers have grown rapidly since 1929, they have not grown as fast as the non-Native population. The proportion of Alaska Natives has declined steadily over time.

The 1990 census showed that 134,551 persons, or 24.5% of the population of Alaska, considered themselves to be some race other than White. The number and proportions of persons by race and tribal group are shown in Table 1.4.

Of the 550,043 persons in Alaska in 1990, Native Americans made up 85,698. For this publication, all Native Americans living in Alaska are referred to as Alaska Natives, even though a small percentage of them belong to continental U. S. tribal groups. Approximately half of the Native Americans belonging to tribes from the Lower 48 states, were born in Alaska. On the other hand, about 20% of all Alaska Natives are estimated to be living outside of Alaska. The economic boom of the early 1980s brought many non-Natives to the state. As a result, the proportion of Alaska Natives dropped from 16.0% in 1980 to

15.6% in 1990. Alaska Natives made up 4.4% of all Native Americans in the U.S.

The White population accounted for 415,492 persons or 75.5% of the population in 1990. Other races, primarily Black, and Asian and Pacific Islanders accounted for 48,853 persons or 8.9% of the population in 1990. These groups were up from 27,521 or 6.8% in 1980.

Figure 1.3 illustrates the statewide population change which took place among the various races from 1980 to 1990. Whites had the largest numerical increase (+105,764) followed by Alaska Natives (+21,595), Asian and Pacific Islanders (+11,674), Blacks (+8,808), and Other Races (+351). Most notable was the substantial increase in the Asian and Pacific Islander population due to a large amount of Asian immigration to Alaska since 1980.

Although Asian and Pacific Islanders composed only the fourth largest race, the population had the third largest numerical increase and had by far the highest percentage gain from 1980, 144.9%. Asian and Pacific Islanders are disproportionately found in Anchorage Borough, Kodiak Island Borough, Juneau Borough, and Aleutians East Borough.

Among Alaska Natives, Eskimos increased by 10,257 persons or 30.0%, American Indians increased by 9,376 or 42.9%, and Aleuts increased by 1,962 or 24.3% during the decade. The distribution of Alaska Natives is discussed at greater length in the next chapter.

During the decade the Black population also increased by 70.8%. In 1990, 89.5% of the Black population of Alaska lived in Anchorage and Fairbanks North Star Borough. It was estimated that at least 40% of the Black population of the state are military or military dependents. The growth of Blacks in the military in Alaska during the decade, however, was only about 32%, so much of the black increase appears to be among the nonmilitary in these communities.

In 1990, there were some 17,803 persons of Hispanic origin in Alaska. This was a 87.3% increase from 9,507 in 1980. In 1990, Hispanics comprised 3.2% of the population of Alaska compared to 9.0% nationwide.

## Age/Sex/Race Composition

To produce the July 1990 state estimate, the cohort component model used during the 1980s was carried forward and controlled to the April 1, 1990 Census total for all known age/sex groups. In addition, a mix of model and age data from the Alaska Permanent Fund was used to estimate individual age groups. This model should compare favorably with 1990 census data by single year of age and sex when it is released.

Tables 1.5 and 1.7 show estimates of Alaska's population by detailed age and sex for July 1, 1990 and April 1, 1980. The estimate for July 1990 is based on the total population by age, race and sex for 1990.

The size of each age group in the population under forty has been affected by several events. The first key event was the baby boom which began after World War II and peaked during the late 1950s and early 1960s. The boom occurred when the American family began to average one more child per family, compared to the depression and war years, and the current national family size of about two children. In addition, the age at first marriage dropped and children were spaced a little closer together than in the preceding decades. During the late 1960s and 1970s, the average family size began to decline. This was due to increasing participation in the labor force by females, changing life styles, and better family planning. Currently, U.S. families are well planned and average slightly more than two children.

In general, Americans have been delaying the birth of children after marriage and having children farther apart. Marriage has been postponed until later and rates of divorce are high. Fertility in Alaska reached a low point in 1976 and has increased slowly up to 1990. The number of children born each year is increasing mainly because the baby boom generation is passing through the key child bearing ages. Births to "baby boomers" have not been as high as they could have been. The baby boom generation has married later, postponed children and had fewer chil-

... Information not available.

dren. Currently in Alaska, as well as the U.S., there is an upswing in births to these baby boom mothers, particularly those in their 30s. The relatively young average age of the Alaska population makes for many households with young children.

While these trends are reflected as part of the changing age structure of Alaskans, fertility has less impact on the population than does migration. Migration is particularly high for 18-35 year olds and their young children under school age. A decline in fertility from 1986 to 1988 corresponded to a net negative migration for this period. In-migration and fertility rates began increasing in 1989.

## Specific Age Groups

The growth trends for various age groups may differ sharply from those of the population as a whole. This is due to differences in historical patterns of fertility, mortality, and migration by age. The population trends for age groups are found in Table 1.9 and Figures 1.5 and 1.6. Population estimates by single year of age/sex for 1990 and 1980 are found in Tables 1.5 and 1.7.

There were some 54,983 children under the age of five in 1990 compared with 38,949 in 1980. They made up 9.9% of the state's population. Between 1980 and 1990 there was a 41.2% increase in the number of children under 5, indicating that this age group grew more rapidly than the total population. Between 1985 and 1990 the number of children under five declined by 8.3% because of a net loss due to migration.

The population aged 5-13, those persons of elementary and junior high school age, increased to about 87,564 by 1990 compared to 62,363 in 1980. Currently 15.8% of the state's population is in this age range as compared to 15.5% in 1980.

The population of high school age children has been much more stable over the years. Alaska's adult population has traditionally been too young to have large numbers of high school age children. In the past, some high school age students have attended boarding schools outside Alaska. This practice is declining. In 1990, there were 30,444 persons aged 14-17 in Alaska (29,433 in 1980). They made up 5.5% of the population (down from 7.3% in 1980). This age group is less subject to changes in migration flows than younger age groups because their parents are older and more stable workers.

The age group 18-24 is most subject to increases and declines in economic conditions. While nationwide this group was declining dramatically, it increased in Alaska to a high of 70,175 in 1984. Since 1984 this group has declined in Alaska to 56,381 in 1990, a decrease of 19.7% in six years.

The population aged 25-34 is composed of young adults in the prime ages for family and household formation. By the estimate, this age group peaked in Alaska at 128,401 in 1986. This age group increased almost 24.9% from 1980 to 1990. The families in this age group contributed to the rapid growth in the number of children under five. By 1990, the persons in this age category had declined to 113,450, a loss of 11.6% of young householders since 1986.

The population aged 35-44 represents the leading edge of the post World War II baby boom. Rapid growth in this age group since 1980 has resulted from an increased migration of more established families as well as the aging of the Alaska population. In spite of overall losses in the state's population in the 1986-87 period, this age group continued to grow reaching its highest level of 104,232 persons in 1990. This age group has also had the greatest numerical increase (50,210 or 92.9% since 1980), and is proportionally the most rapidly growing age group.

The ages 45-54 and 55-64 have traditionally been ages at which many Alaskans begin to move south. These age groups have continued to grow throughout the 1980s. By 1990, there were about 54,442 persons 45-54 and 29,645 persons 55-64 in the state. In general, middle aged Alaskans were more willing to stay in Alaska during the 1980s than in prior decades.

The 1990 estimate of the number of persons 65 years old or over is 22,459. Considering the size of the population currently 55-64, the number of senior Alaskans is likely to continue to increase rapidly in coming years. The estimate suggests a

94.5% increase in older Alaskans since 1980, one of the largest percentage increases in the population over 65 of any state. Alaska also has one of the smallest proportions of persons over 65 (4.1%) in the nation.

### Median Age

The population in Alaska is younger than the national average. Further, the Alaska Native population is much younger than the White population because of its high fertility rate. The 1989 median age in the United States was 31.5 for males and 33.8 for females. The 1990 median age for males in Alaska was 28.5 and the median age for females was 28.4 years. This was an increase of 2.2 and 2.7 years respectively since 1980.

### Voting Age Population

According to the April 1, 1990 census, the voting age population was 377,699. Whites made up 294,308 (77.9%), Alaska Natives 50,945 (13.5%), Blacks 14,553 (3.9%), Asian & Pacific Islanders 13,491 (3.6%) and Other Races 4,402 (1.2%). Ethnicity is separate from race. Many persons who list themselves as Other Races are of Hispanic Origin. In 1990 there were 11,048 voting-aged persons of Hispanic Origin. This number is equivalent to 2.9% of the voting age population. Although Alaska purges voter registrations every two years, areas with high turnover may contain up to 20% more registered voters than residents due to turnover.

Source: U.S. Census of Population and Houseing, 1990,1980.

### Dependency

Dependency ratios show how large a burden of support is placed on the working age population by the young and old segments of the population. In 1990, statewide every 100 persons of working age supported 48.5 children and 6.3 persons over 65. In 1980, every 100 persons of working age supported 50.4 children and 4.4 persons over 65.

### Sex Composition

In April of 1990, an estimated 260,176 persons, or 47.3% of Alaska's population, were female compared to 51.2% female for the United States in 1989. Traditionally, a high ratio of males to females has been associated with the American frontier. The myth that Alaska has substantially more men than women continues to be perpetuated in the popular press. A few Alaskan communities tend to be more heavily male because employment may be transient or concentrated in occupations which have traditionally employed mostly males. Most communities, however, have sex ratios more in line with the rest of the nation. The presence of military installations, logging, fishing, or mining operations are the main sources of distortion for the sex ratio in the state. The young age of the population also increases the overall male proportion slightly. Older populations have more women because of the greater life expectancy among women at older ages.

The highest sex ratios by age in 1990 occurred among groups aged 40-44, 45-49, and 50-54. The sex ratios were 124 (that is 124 men for every 100 women), 121 and 121, respectively.

## Housing Units and Households

The census counts all persons as living either in households or group quarters. A household occupies a housing unit. The census definition of a housing unit is a house, an apartment, a group of rooms or a single room intended as separate living quarters. Boats, tents, vans, and caves are included if they are occupied as a usual place of residence. Vacant mobile homes are included provided they are intended for occupancy on the site where they stand. Seasonal residences, forest service cabins, or vacant cabins which are habitable are included in the inventory. In 1990, the census counted some 232,608 housing units in Alaska, 188,915 of which were occupied, 43,693 vacant. In 1980, the census counted 162,825 housing units, 131,463 of which were occupied and 31,362 vacant. This indicates an increase of 69,783 during the decade or a growth of 42.9% in housing units. The number of occupied housing units or households in Alaska increased by 57,452 or 43.7% during the decade. The vacancy rate for 1990 declined to 18.8% compared to 19.3% in 1980. Since the population of the state grew by 36.9% during the decade, housing and household growth outstripped the growth of population. Following the national trend, the number of persons per household in Alaska declined by 0.13 persons from 2.93 in 1980 to 2.80 in 1990. During the same period, the U.S. persons per household declined by 0.12 persons from 2.75 in 1980 to 2.63 in 1990.

### Households

Persons in households and counts of households appear in Tables 1.10 and 1.11. Some 529,342 persons lived in 188,915 households in Alaska in 1990. Of the population, 454,726 persons or 82.7% lived in 132,837 family households. That is, in a household containing a householder and one or more persons related by birth or marriage. Not all households contain families. A household may also be composed of a group of unrelated individuals or one person living alone. The remaining 74,616 persons, 13.6% of all persons, lived in 56,078 nonfamily households. Overall, 70.3% of all households were family households and 29.7% were nonfamily households.

Family households can be further broken into husband-wife, male-headed and female-headed households. A married couple household is a family in which the householder and spouse are counted as members of the same household. Male and female headed households consist of a single adult head and at least one younger or older dependent.

### Older Alaskans

In 1990, there were 22,369 persons over 65 living in 16,809 households with at least one person over 65. Of these people, the majority, 14,806 (66.2%), were in 10,571 family households. Almost three out of ten older Alaskans (6,357) lived in 6,238 nonfamily households. Most nonfamily households (5,727 households) contained a person over 65 living alone. In 1990, the occupant lived alone in 34.1% of all households with at least one person over 65. The remaining 501 households contained two or more unrelated individuals sharing a residence. Households containing older Alaskans accounted for 8.9% of all Alaska households in 1990, and 13.7% of all households containing persons living alone. 25.6% of all older Alaskans lived alone. In 1990, 1,196 persons over 65 lived in group quarters, 1,102 of them in institutions. Of all institutionalized persons in Alaska, 24% were over 65.

### Group Quarters Populations

Group quarters are living quarters shared by ten or more unrelated persons.These include correctional institutions, nursing homes, mental (psychiatric) institutions, juvenile institutions, college dorms, military barracks, homeless shelters, persons living on the street, commercial ships, military and Coast Guard ships, and remote work sites, cannery or lumber camp dorms. In 1990, there were 20,701 persons or 3.8% of the population living in group quarters in Alaska. This compares to 16,260 or 4.1% in 1980. The remaining 96.2% of the 1990 population lived in households. Institutionalized persons increased by 2,409 persons or 111.3% between 1980 and 1990 in the state. Ninety percent of this increase is accounted for by the growth of prison inmates during the decade. Most of the remainder is accounted for by the increase in nursing home populations. Noninstitutional group quarters populations have experienced only modest growth (14.4%) during the decade.

Of these group quarters college dorms and military barracks have been stable or declined while ships and work site dorms have grown.

For the first time, the Census Bureau released information related to the homeless. It does not purport to be a complete count of the homeless. However, during the 1990 census, 447 persons were counted in emergency shelters for the homeless and another 79 persons were counted as visible in street locations.

### Marital Status

In 1990, 226,701 persons or 56.6% of the population 15 and over were currently married and not separated. The currently married declined from 58.1% in 1980. Marital statistics only tell current marital status, so that divorced or widowed persons who have remarried are listed as currently married. The total proportion never married also declined from 29.0% in 1980 to 27.2% in 1990. Some 8,601 or 2.1% of persons were separated, an increase of 68.2% up from 1.7% in 1980. The largest increase was in persons currently divorced. In 1990, 44,541 persons or 11.1% of all persons 15 and older were currently divorced, up from only 8.5% in 1980. The number of persons currently divorced increased 78.6%, twice as fast as the growth of the state's population. As the population has aged, the number and proportion of the population widowed has also increased. The number of widowed increased 53.1% to 11,623 in 1990. The statistics on changing marital status, along with the increasing proportion of persons living alone confirm the continuing decline in traditional families in Alaska and the U.S.

# CHAPTER 2

## POPULATION TRENDS

### FOR ALASKA BOROUGHS & CENSUS AREAS

## Introduction

Unlike the rest of the United States which is entirely organized into counties, Alaska still remains predominately unorganized. At the time of the 1990 Census, there were 14 boroughs which were equivalent to county governments in the rest of the U.S. Three of these boroughs, Anchorage, Juneau and Sitka, were city/boroughs which have the equivalent of city/county governments. Miami/Dade county in Florida and Oklahoma city/county are examples of this type of government. The other boroughs were Aleutians East Borough, Bristol Bay Borough, Fairbanks North Star Borough, Haines Borough, Kenai Peninsula Borough, Ketchikan Gateway Borough, Kodiak Island Borough, Lake and Peninsula Borough, Matanuska-Susitna Borough, North Slope Borough, and Northwest Arctic Borough. Since the census, one additional borough (Denali Borough, incorporated December 7, 1990) has been formed out of part of the Koyukuk-Middle Yukon Census Subarea of Yukon-Koyukuk Census Area. Each of these boroughs has independent, incorporated communities within its boundaries.

There is not a direct correspondence between all of the borough and census area boundaries of 1980 and 1990. The boundaries of the Northwest Arctic Borough correspond to Northwest Arctic Native Association boundaries and include the 3,298 square miles of land transferred from North Slope Borough. No population was involved in this land transfer, so the historical series is still 100% compatible with the Kobuk Census Area and North Slope Borough for 1980 onward. Aleutians East Borough and Aleutians West Census Area were formed out of the 1980 Aleutian Island Census Area and a small area of land transferred from Dillingham Census Area which contained no people. Similarly, Lake and Peninsula Borough and the 1990 Dillingham Census Area were formed out of the 1980 Dillingham Census Area. At the time of its formation a segment of the Dillingham Census Area containing 22 housing units, but no population was annexed to the Kodiak Island Borough. In addition, a segment of the northern most part of the 1980 Dillingham Census Area was transferred to the Aniak Census Subarea of the Bethel Census Area. This segment contained no population or housing units. The Denali Borough was formed out of the Yukon-Koyukuk Census Area and includes Denali National Park and all communities on the Parks Highway between Anderson and the Matanuska-Susitna border. These communities are Cantwell, McKinley Park, Healy, Anderson, Ferry and Lignite. The Borough also includes a small portion of Southeast Fairbanks Census Area which may hold a few scattered individuals. Due to the recent formation of the Denali Borough, no recount of the 1990 Census to certify a 1990 population for the Borough has yet been made. The population estimate of Denali Borough for April 1, 1990 was approximately 1,750 persons.

Source: Alaska Department of Labor, Research & Analysis, Demographics Unit.

The remaining unorganized territory was divided into 11 census areas for enumeration by the U.S. Census Bureau. While these are only statistical units, they are widely recognized by all federal and most state agencies as county equivalents for Alaska. Some program service areas, however, have different geography. While not universal, many of the boundaries of the census areas tend to follow native regional corporation boundaries. The reader may refer to the maps that accompany the place estimates in Chapter 4 of this publication for help in identifying borough and census area boundaries of Alaska.

## Borough and Census Area Population Trends 1960-1990

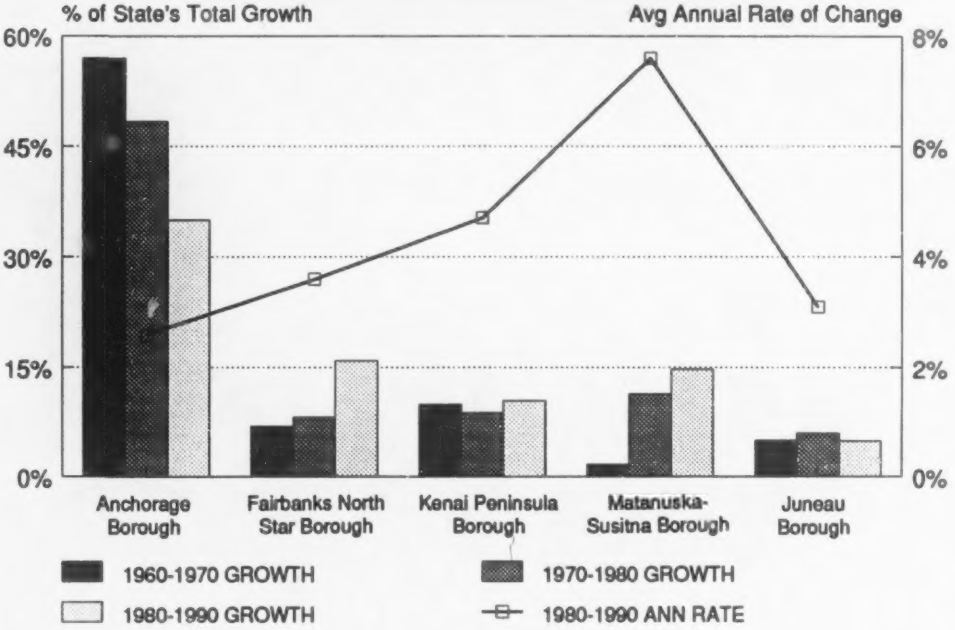
Alaska's population grew by 323,876 persons between April 1, 1960 and April 1, 1990, an increase of 143.2% in thirty years. The state's population increased by 148,192 or 36.9% during the past decade. Much of this growth has been in urban and suburban areas of the state.

In 1990, 226,338 persons, or 41.1% (Table 2.1) of Alaska's population lived in the Municipality of Anchorage. The five largest boroughs or census areas were Anchorage Borough, Fairbanks North Star Borough (77,720), Kenai Peninsula Borough (40,802), Matanuska-Susitna Borough (39,683), and Juneau Borough (26,751). These contained 74.8% of Alaska's population in 1990 compared to 72.4% in 1980. The remainder of the state contained an estimated 138,749 persons in 1990.

From July 1960 to April 1990, five areas accounted for 81.5% of the state's growth: Anchorage Borough (+143,505 or 173.2% increase), Fairbanks North Star Borough (+37,104 or 91.4% increase), Matanuska-Susitna Borough (+34,495 or 664.9% in-

Figure 2.2

## GROWTH TRENDS OF THE TOP FIVE POPULATION AREAS 1960-1990



Source: Alaska Department of Labor, Research & Analysis, Demographics Unit.

crease), Kenai Peninsula Borough (+31,749 or 350.7% increase), and Juneau Borough (+17,037 or 175.4% increase). The total aggregate growth for these boroughs was an increase of 263,890 or 179.0%. Growth has been somewhat slower, but still rapid by national standards in the balance of the state which grew by 59,986, or a 76.2% increase between April of 1960 and April of 1990.

Figure 2.2 illustrates growth trends in the five largest population areas over the past three decades. Growth is shown as a percentage change in the area's share of the state's total growth. For each of the past three decades, Anchorage received a smaller share of the state's total growth each decade. Although the population increased by 178,000 from 1960-1990, Anchorage's portion of the state's growth declined from 57.0% in 1960-70 to 35.0% in 1980-1990. Two areas, Fairbanks North Star Borough and Matanuska-Susitna Borough, experienced a marked increase in their share while Kenai Peninsula Borough and Juneau Borough basically maintained their shares over the periods. Growth rate was strongest during 1980-1990 in Matanuska-Susitna Borough which experienced an average annual rate of change of 7.6%, almost three times the rate of Anchorage (2.6%).

## Housing Unit and Household Counts

The Census Bureau has also released 1990 information on housing units, households and group quarters for Alaska by census area and place.

### Housing Unit Change

As shown in Table 2.3, the number of occupied households in Alaska was esti-

Source: Alaska Department of Labor, Research and Analysis, Demographics Unit.

mated as 188,915. The number of persons per household declined slightly from 2.93 persons in 1980 to 2.80 in 1990. 1990 households ranged in size from 3.4 to 4.2 persons per household in the predominately Native areas of north and west Alaska to 2.6 to 2.7 persons in Anchorage, and some areas of southeast Alaska such as Juneau, Ketchikan-Gateway and Haines boroughs.

## Components of Change

### Births and Deaths

Births and deaths for census areas and labor market areas appear in Table 2.4. The average birth rate for the state in the 1980-90 period was 24.4 per 1000 population. The highest birth rates were found in the heavily Native areas of the state: Wade Hampton Census Area (37.8), Northwest Arctic Borough (36.2), Lake & Peninsula Borough (33.2), North Slope Borough (32.3), Bethel Census Area (30.8), Dillingham Census Area (30.4), Nome Census Area (30.2). The lowest birth rates were found in areas of southeast Alaska: Skagway-Yakutat-Angoon Census Area (18.5), Haines Borough (18.7), Ketchikan Gateway Borough (20.3), Sitka Borough (20.6) and Juneau Borough (21.4). Heavily military and fishing areas such as the Aleutians West Census Area (16.2), Bristol Bay Borough (17.9), and Aleutian Islands East Borough (18.6) also have lower fertility rates.

The average death rate for the state in the 1980-90 period was 4.1 per 1000 population. During the decade, mortality was highest in heavily Native areas of the state: Nome Census Area (7.2), Northwest Arctic Borough (7.1), Lake and Peninsula Borough (7.1), Wade Hampton Census Area (7.0), Yukon-Koyukuk Census Area (6.8), Dillingham Census Area (6.1), Bethel Census Area (5.6), and North Slope Borough (5.5). As these areas also have younger populations, the higher mortality rates are even more noticeable. Areas of the state with older populations also had higher than average death rates during the decade: Ketchikan Gateway Borough (6.1), Wrangell-Petersburg Census Area (5.8), and Sitka Borough (5.5).

The lowest death rates during the decade were found in Aleutians West Census Area (2.0), Anchorage Borough (3.4), Bristol Bay Borough (3.4), Fairbanks North Star Borough (3.6), Prince of Wales-Outer Ketchikan Census Area (4.0), Juneau Borough (4.2), Matanuska-Susitna Borough (4.2), and Southeast Fairbanks Census Area (4.2). Several of these areas have young transient segments of population associated with the military, fishing or timber. It is possible that some death certificates for Prince of Wales-Outer Ketchikan Census Area were erroneously attributed to Ketchikan Gateway Borough.

### Migration

Flows of migrants within boroughs and census areas are made up of people coming from or going to other states and people coming from or going to other areas of Alaska. Net flows for the 1980s are shown in Table 2.4. During the 1980s, net migration was greater than natural increase in Matanuska-Susitna Borough, Kenai Peninsula Borough, Prince of Wales-Outer Ketchikan Census Area, Skagway-Yakutat-Angoon Census Area and Aleutians East Census Area. The areas which gained the most through net migration during the decade were Anchorage Borough (27,078), Matanuska Susitna Borough (16,006), Kenai Peninsula Borough (9,306), Fairbanks North Star Borough (9,095) and Juneau Borough (5,736).

Nine areas experienced net out-migration during the decade: Southeast Fairbanks Census Area (-1,020), Yukon-Koyukuk Census Area (-932), Wade Hampton Census Area (-483), Sitka Borough (-464), Bethel Census Area (-444), Northwest Arctic Borough (-309), Lake and Peninsula Borough (-118), Dillingham Census Area (-101), and Wrangell-Petersburg Census Area(-99). Yukon-Koyukuk Census Area and Northwest Arctic Borough also experienced net out-migration for the 1970-80 decade.

## Population Composition

### Race Composition

Tables 2.5 and 2.6 show borough and census area population by race, Hispanic origin, and labor market region.

Since 1980, the number of Alaska Natives increased in all boroughs and census areas

Alaska Department of Labor, Research & Analysis, Demographics Unit.

Source: U.S. Census of Population and Housing, 1980, 1990 as shown in Table 2.6. The largest numerical increases occurred in Anchorage Borough (5,616), Fairbanks North Star Borough (2,343), Bethel Census Area (2,123), Juneau Borough (1,272), Matanuska-Susitna Borough (1,251), Kenai Peninsula Borough (1,197), North Slope Borough (1,111), Northwest Arctic Borough (1,096), Wade Hampton Census Area (1,058), Nome Census Area (974), Prince of Wales-Outer Ketchikan Census Area (707), Dillingham Census Area (494), Ketchikan Gateway Borough (492), Yukon-Koyukuk Census Area (360), and Kodiak Island Borough (242).

More Alaska Natives now live in Anchorage (14,569) than in any other borough or census area. Bethel Census Area which had the largest number of Alaska Natives in 1980 dropped to second place with 11,370. The proportion of Alaska Natives increased during the 1980s in Anchorage Borough, Matanuska-Susitna Borough, Kenai Peninsula Borough, Fairbanks North Star Borough, Southeast Fairbanks Census Area, Yukon-Koyukuk Census Area, Northwest Arctic Borough, Haines Borough, Juneau Borough, Ketchikan Gateway Borough, Wrangell-Petersburg Census Area, and Wade Hampton Census Area. Two phenomena account for the changes in these areas, the gradual urbanization of the Alaska Native population, and higher native fertility. Alaska Natives declined as a proportion of the population in all other census areas.

In 1990, 41,380 or 48.3% of all Alaska Natives still lived in census areas where Natives made up more than half of the population. This percentage declined slightly from 1980 when it was 54.5%. Because of increased out-migration from rural areas, the proportion of the Native population that lived in census areas with less than eight percent Native population grew to 28.9% from 22.4% in 1980. The four boroughs with populations less than eight percent Native in 1990 were Anchorage, Matanuska-Susitna, Fairbanks North Star and Kenai Peninsula Borough.

Geographically, the Alaska Native population has shown only a slight redistribution since 1980. The greatest increase occurred in the Anchorage/Matanuska-Susitna region which contained 15.0% of the Alaska Natives in 1980 and 19.3% in 1990. Proportional declines occurred in the Southwest region (30.3% to 27.5%) and Northern region (19.5% to 19.3%). Specifically, there was an increase in the proportion of all Alaska Natives in Anchorage Borough, Matanuska-Susitna Borough, Kenai Peninsula Borough, Fairbanks North Star Borough, North Slope Borough, Juneau Borough, and Prince of Wales-Outer Ketchikan Census Area. The proportion of the state's total Native population declined in all other regions and census areas. The changing geographic distribution reflects a gradual movement of Alaska Natives from small rural native villages to larger mainly white urban centers. Significantly, the degree of change during this period of general rapid urban growth remained relatively small. These relatively small changes reflect the strong desire of many Alaska Natives to retain traditional styles of life.

## Age/Sex Counts

Normally age/sex distributions for boroughs, census area and labor market regions are included in the *Alaska Population Overview*. Because of the timing of the release of the 1990 census, these numbers will be presented in *Alaska Population Projections* which will be available this summer.

# CHAPTER 3

## COUNTS & ESTIMATES

### FOR SPECIAL POPULATIONS & AREAS

## Introduction

Estimates for special populations and areas were recently added to the publication. Future issues will be expanded to include other frequently requested special population estimates.

## Armed Forces Estimates

The role of Armed Forces' population in Alaska has always been significant in the state's population and population growth. Currently, the overall Armed Forces' population of Alaska is relatively stable. Because of the rapid increase in the civilian population since 1980 and the diversification of the Alaskan economy, the military and dependent populations declined as a proportion of the total population of the state. Estimates for 1990 appear in Table 3.1.

In 1990, there were approximately 24,645 Armed Forces' personnel in Alaska, slightly higher (+8.6%) than in 1980. The proportion of military, however, continued to decline from 5.5% of the state's population in 1980 to 4.5% in 1990. Dependents of Armed Forces' personnel, in 1990, made up another 32,889 persons. This made the proportion of military and dependents in Alaska 10.5% of the state's population, down from 11.9% in 1980. Statewide, military and military dependents have increased by only 8,040 since July 1980. The growth of military and dependents accounted for only about 1.9% of the state's overall increase of 36.9% between April 1980 and April 1990.

When the size of military and dependent populations are considered relative to local nonmilitary populations, some bases play a significant role in local areas. The Adak naval base dominated the Aleutians West Census Area where military and dependents accounted for 53.1% of the population. This military presence increased 51% since 1980.

The military influence of Eielson AFB and Ft. Wainwright in Fairbanks North Star Borough is also significant. Military and dependent populations grew by 6,039 or 47%. In 1990, they accounted for 24% of the residents of the borough, up slightly from 22% in 1980.

Because of the rapid growth of the population of Anchorage over the decade, the relative influence of military and dependents assigned to Elmendorf AFB and Ft. Richardson in the municipality declined. In 1980, military and dependents accounted for 15.2% of the Anchorage population. By 1990, that proportion had declined to 12.1%.

Military and dependents at Fort Greely accounted for some 19.6% of the population of Southeast Fairbanks Census Area in 1990. More specifically, the population of the immediate Delta Junction/Fort Greely area of Southeast Fairbanks remained quite stable at between 3,774 in 1980 to 3,721 in 1990. Cutbacks in military and dependents at Ft. Greely over the decade caused a significant decline of that base's influence in the area from more than 52.3% in 1980 to only 31.1% in 1990.

In Yukon-Koyukuk Census Area, the military played a key role in the communities of Galena and Anderson. The Air Force's role at Galena grew slightly during the decade. It accounted for 35.2% of the population of Galena in 1980 and 37.8% in 1990. Clear AFB accounted for 23.2% of the population of Anderson in 1980, but declined to 18.8% in 1990. Current cuts may lead to a further decline in the role of the military in the Anderson area. The Air Force also played a major, but declining role in Bristol Bay Borough, where the military accounted for 19.9% of the population in 1990, down from 28.7% in 1980.

The local influence of the Coast Guard in Kodiak Island Borough has also been historically significant. The area of the city of Kodiak and its immediate vicinity contained about 11,900 persons in 1990, an increase from about 8,579 in 1980. Coast Guard personnel and their dependents in 1990 accounted for about 20.5% of the local population, down slightly from 24.9% in 1980.

The role of the Air Force in the state at a number of remote sites has declined during the decade as automation and satellites have made old ground stations obsolete.

## Legislative House and Senate District Counts

The current House and Senate areas of the Alaska State Legislature were established by the redistricting plan of 1984. Currently, the Governor's Redistricting Board is considering a new redistricting plan to reapportion the Alaska State House and Senate. The 1990 census counts for current districts are shown in Tables 3.2 and 3.3. While 1984 populations used for redistricting purposes were adjusted for military nonresidents, a completely comparable adjustment could not be made with this set of estimates. The adjustment in the 1984 redistricting plan was made using an estimate of the location of off-base military population produced by the Institute of Social and Economic Research. Since these residence patterns may have changed, the only adjustment possible for 1990 was for on-base military nonresidents. It is clear from these counts that the differential growth of the state in the 1980s will require a number of district shifts in the new redistricting plan. The probable size of House Districts in 1990 will be about 13,750 residents if military nonresidents are included and the probable size of Senate Districts will be about 27,500.

## Alaska Native Regional Corporation Counts

The 12 Alaska Native Regional Corporations in Alaska established as part of the Alaska Native Claims Settlement Act, include all areas of the state except the Annette Island Reserve, Alaska's only American Indian Reservation. Their boundaries are shown in Figure 3.1. Census counts by race of the populations living within the geographic areas held by the regional corporations are shown in Table 3.4. The counts of Native population living within these regions do not necessarily represent shareholders of these corporations.

During the past decade, the distribution of Native American population relative to the different corporate regions has not changed significantly. Overall, there was a slight decline in the proportion of Alaska Natives in the state and all regions except AHTNA, Chugach, Cook Inlet, NANA, and Sealaska Corporation regions.

Numerically, the largest growth in Native American population within the corporate regions occurred in Cook Inlet (+7,727), Calista (+3,181), Sealaska (+2,798), Doyon (+2,745), Arctic Slope (+1,111), and NANA (+1,096). The large increase in the number of Natives living inside the Cook Inlet Region resulted from the growth of the proportion of Natives living in Anchorage. The remaining regions grew by less than 1,000 each in the 1980-90 period.

## School District Estimates

School districts use population estimates for planning purposes. Districts can allocate resources more effectively when they know the magnitude of population change. The populations in Table 3.5 are for total district populations, and not school age populations.

Table 3.1

# POPULATION ESTIMATES FOR BOROUGHS AND CENSUS AREAS BY CIVILIAN AND MILITARY STATUS, 1980, 1990

Detailed school age populations by district have not yet been released by the Census Bureau. The number of persons under 18 years of age is available (Table 3.5) and may serve as an approximation of the number of persons potentially served by districts. The proportion of Alaska's population living in each district and the proportion of the population under 18 in each district is also shown.

# CHAPTER 4

## POPULATION, HOUSING UNIT & RACE COUNTS FOR PLACES

### Introduction

This section contains counts of population and housing for April 1, 1990 and 1980. These are presented for all incorporated places, census designated places (CDPs), Alaska Native Village Statistical Areas (ANVSAs) and the rural balances of both census areas and census subareas (CSAs). Counts for places are presented in two forms, by census area and alphabetically. The alphabetical listing also includes places ranked by size in 1990 and 1980 as well as cities ranked by size in 1990. These counts are found in Tables 4.2 , 4.3, 4.4 and 4.5, respectively.

A wide variety of information is presented for communities for both 1980 and 1990. This includes population, group quarters, persons per household, population change 1980-90, total, occupied and vacant housing units, land and water area, population density, persons 18+, and population by race and Hispanic origin.

### Characteristics of Places

Changes in the population for places observed between 1980 and 1990 may result from changes in geography. While it insures that the geography is comparable for 1980 and 1990 for boroughs and census areas, it cannot insure comparable place level geography for counts. Places may show population change as a result of real change or a change in the boundaries of the community. In the case of cities, this can be through annexation. In the case of Census Designated Places and Alaska Native Village Statistical Areas, all boundaries for 1990 are different from 1980 but may include the same basic population.

While general maps for places are included here, detailed paper and machine readable maps of Alaska showing place boundaries, roads, and major hydrography are available as part of the Census Bureau's Topologically Integrated Geographic Encoding and Referencing (TIGER) mapping. While too new to include in this publication, TIGER maps will improve the ability to display census and estimates information beginning in the next year.

## Cities

As of January of 1990, there were 152 incorporated cities in Alaska. In 1990, 19 cities were considered urban (2,500 or greater) by U.S. Census Bureau definition. These cities in 1990 rank order are listed below:

| 1990 Rank | 1980 Rank |  | 1990 Population | 1980 Population |
|---|---|---|---|---|
| 1. | 1. | Anchorage city/borough | 226,338 | 174,431 |
| 2. | 2. | Fairbanks city | 30,843 | 22,645 |
| 3. | 3. | Juneau city/borough | 26,751 | 19,528 |
| 4. | 4. | Sitka city/borough | 8,588 | 7,803 |
| 5. | 5. | Ketchikan city | 8,263 | 7,198 |
| 6. | 6. | Kodiak city | 6,365 | 4,756 |
| 7. | 7. | Kenai city | 6,327 | 4,324 |
| 8. | 8. | Bethel city | 4,674 | 3,576 |
| 9. | 9. | Valdez city | 4,068 | 3,079 |
| 10. | 21. | Wasilla city | 4,028 | 1,559 |
| 11. | 14. | Homer city | 3,660 | 2,209 |
| 12. | 11. | Nome city | 3,500 | 2,544 |
| 13. | 12. | Soldotna city | 3,482 | 2,320 |
| 14. | 13. | Barrow city | 3,469 | 2,267 |
| 15. | 10. | Petersburg city | 3,207 | 2,821 |
| 16. | 22. | Unalaska city | 3,089 | 1,322 |
| 17. | 16. | Palmer city | 2,866 | 2,141 |
| 18. | 17. | Kotzebue city | 2,751 | 2,054 |
| 19. | 19. | Seward city | 2,699 | 1,843 |

Cities with 1990 populations between 1,000 and 2,500 were Wrangell (2,479), Cordova (2,110), Dillingham (2,017), North Pole (1,456), Craig (1,260), Haines (1,238), and Sand Point (1,087)

## Census Designated Places

An additional 163 unincorporated communities qualified as census designated places (CDPs) in 1990. To qualify as a CDP, a place must have a community character, 25 or more persons residing in it at the time of the 1990 census, and it must have been recognized as possibly fitting this definition in 1986 when the Census Bureau began planning the 1990 census.

Since CDPs have no incorporated boundaries, the limit of the settled area in 1990 was defined according to geographic features such as streams, roads or ridges which encompass the settled area. These definitions may be similar to the 1980 boundaries which did not follow geographic features but usually circled the settled area. In Alaska, most small isolated communities had few if any persons living near, but not in the place. In areas such as Matanuska-Susitna, Kenai and similar densely settled areas, the boundaries for CDPs may be substantially different from the 1980 definition.

Alaska had several large CDPs which were bigger than many of its incorporated cities and would meet the Census Bureau definition of urban places: College (11,249), Eielson Air Force Base (5,251) in Fairbanks North Star Borough; Adak Station (4,633) in Aleutians West Census Area; Sterling (3,802) and Nikiski (2,743) in Kenai Peninsula Borough. Several others had populations between 1000 and 2,500: Meadows Lakes (2,374), Butte (2,039) and Big Lake (1,477) are in Matanuska-Susitna Borough; Kodiak Station (2,025) in Kodiak Island Borough; Ridgeway (2,018) and Fritz Creek (1,426) are in Kenai Peninsula Borough; Metlakatla (1,407) in Prince of Wales-Outer Ketchikan Census Area; and Fort Greely (1,147) in Southeast Fairbanks Census Area. Such places are ripe for annexation or incorporation.

There were a number of communities which became CDPs for the first time in 1990:

Aleutians West Census Area: Amchitka (25)

Fairbanks North Star Borough: Pleasant Valley (401)

Haines Borough: Covenant Life (47), Lutak (45), Mosquito Lake (80)

Kenai Peninsula Borough: Cohoe (508), Crown Point (62), Fox River (382), Happy Valley (309), Nikolaevsk (371), Primrose (63), Ridgeway (2,018)

Kodiak Island Borough: Chiniak (69), Women's Bay (620)

Lake and Peninsula Borough: Port Alsworth (55)

Matanuska-Susitna Borough: Chase (38), Chickaloon (145), Knik (272), Lazy Mountain (838), Meadow Lakes (2,374), Skwentna (85), Trapper Creek (296)

Prince of Wales-Outer Ketchikan Census Area: Dora Bay (57), Edna Bay (86), Hollis (111), Labouchere Bay (149), Long Island (198), Naukati Bay (93), Polk Inlet (135), Port Alice (30), Port Protection (62)

Skagway-Yakutat-Angoon Census Area: Cube Cove (156), Freshwater Bay (68), Hobart Bay (187), Game Creek (61), Whitestone Logging Camp (164)

Southeast Fairbanks Census Area: Alcan (27), Dry Creek (106), Northway Junction (108)

Valdez-Cordova Census Area: Copperville (163), Kenny Lake (423), McCarthy (25), Mendaltna (37), Chenega (97)

Wrangell-Petersburg Census Area: Rowan Bay (133), St John's Harbor (69)

Yukon-Koyukuk Census Area: Ferry (56), Lake Minchumina (32), Lignite (99), and Circle Hot Springs Station (29).

Due to a census error, Shemya Station CDP was not included in the preliminary census statistics. It is not yet known if this error will be corrected in 1990 census publications.

In addition, there were several 1980 Census Designated Places which were not ANVSAs and which were dropped from the 1990 census either at the request of a borough or because their populations fell below the minimum of 25:

Aleutians West Census Area: Attu

Bethel Census Area: Sparrehvohn Station, Cape Newenham

Fairbanks North Star Borough: Big Horn, Murphy Dome

Figure 4.1

Kenai Peninsula Borough: Portage Creek
Ketchikan Gateway Borough: Clover Pass, Herring Cove, Ketchikan East, Mountain Point, North Tongass Highway, Pennock Island, Saxman East
Matanuska-Susitna Borough: Montana
North Slope Borough: Cape Lisburne
Prince of Wales-Outer Ketchikan Census Area: Cape Pole
Yukon-Koyukuk Census Area: Campion Station, Indian Mountain, Suntrana, Usibelli Mine, Tatalina Station.

## Alaska Native Villages

The Alaska Native Claims Settlement Act identified 209 Alaska Native Villages (ANV). Populations were first reported for these in the 1980 Census. At the time of the 1990 census there were 217 Alaska Native Village Statistical Areas (ANVSA). Most of these villages are contiguous with cities or CDPs in the state. The concept of Alaska Native Village Statistical Area (ANVSA) for 1990 is somewhat different than in 1980. In 1980, the boundaries of most Alaska Native Villages corresponded to city or census designated place boundaries. For 1990, the Census Bureau asked village councils to define the boundaries of the ANVSAs. In many cases, these continue to correspond to city or census designated place boundaries. In other cases, they do not correspond. Thus, the 1990 ANVSAs may differ from other community boundaries and they may differ from the ANV boundaries as defined in 1980. Boundaries established for ANVSAs are for statistical purposes only and have no legal status.

According to the U.S. Census Bureau, in only one case did a village council define an ANVSA to be vastly larger than the local community area. The native village of Ninilchik defined the boundary of the

ANVSA to include all of the Kenai Peninsula south of the community of Ninilchik to Kachemak Bay. This includes the communities of Ninilchik, Anchor Point, Nikolaevsk, Homer, Kachemak, and Fritz Creek as well as suburban areas along the highway and around Homer. The resulting data for Ninilchik ANVSA is useless and misleading for almost all statistical purposes. A substitution of Census Designated Place information for Ninilchik ANVSA data is recommended where an accurate portrait of the character of the community of Ninilchik is needed.

In the tables, there are specific indications where 1990 ANVSA boundaries are different from city or CDP boundaries. No attempt has been made, however, to show differences from 1980 ANV boundaries. Between 1980 and 1990 a few zero population native villages were dropped; a few others with very small or zero populations were added. In addition, a few communities which were cities or CDPs but not ANVs in 1980 became ANVSAs in 1990.

There were a few Alaska Native Village Statistical Areas (ANVSAs) which should have become CDPs in 1990, but did not because they were not identified as possible CDPs in 1986. These included Grouse Creek Group (580), Tazlina (247), Alexander (40), and Wiseman (33). The lack of CDP status does not diminish the 1990 census information available for these communities.

## Unorganized Territory

A total of 247,986 square miles of land and 45,351 square miles of water in Alaska lies outside of any incorporated city or borough. This area amounts to 61% of the state's land area. At the time of the census, 24,547 persons or 4.5% of the population of Alaska lived in these areas. The number of persons living in these same areas totaled 19,999 in 1980 and accounted for 5.0% of the population. About 80% of the persons living in areas with no city or borough governments, lived in communities. The number of persons that lived outside of CDPs or ANVSAs and beyond the purview of any government other than the State of Alaska was 4,842 or about 0.9% of the state's population in 1990. About 37% of these lived in Southeast Fairbanks Census Area (primarily around Delta Junction), 18% in Valdez-Cordova Census Area (primarily in the Copper River Valley area), and 12% along the Parks Highway in Yukon-Koyukuk Census Area.

6/ The recognized boundaries of Nome were smaller in the 1980 U.S. Census than the actual legal boundaries. This was corrected by the Census Bureau in 1981. In 1982, Nome annexed the unincorporated place of "Icy View" which had 210 residents and Perkinsville CDP. The 1980 population of Nome reflects its current boundaries.

7/ Revised 1990 census number. Teller's 1982 annexation was not included in census geography.

14/ Denali Borough was formed out of the area between Anderson and the Matanuska Susitna Border, including Denali National Park, Dec 7, 1990.

15/ Galena ANV excluded the Air Force base in 1980. The 1990 ANVSA includes it.

16/ Fort Yukon ANV in 1980 excluded the Air Force Remote Station. The station is no longer active.

# GLOSSARY

**Alaska Native Village Statistical Area** - 1990 census statistical areas which delineate the settled area of each Alaska Native Village Statistical Area (ANVSA). In the 1980 census, these areas were referred to as Alaska Native Villages (ANV). The boundaries may differ between 1980 and 1990. Officials of Alaska Native Regional Corporations and other appropriate officials delineated the 217 ANVSAs for the sole purpose of presenting census data.

**Alaska Permanent Fund** - was created in 1976 by a voter-approved amendment to the state Constitution as a state savings account of oil revenues. A portion of the Fund's income is annually distributed to eligible Alaskan residents. The total equity balance of the Fund currently exceeds $11.5 billion.

**Average Annual Rate of Change** - a standardized statistical measure of the rate of change which can be compared for any number of years because it converts the change for any period to a yearly measure.

**Census Designated Place (CDP)** - a closely settled unincorporated population center of at least 25 persons.

**Cohorts** - a group of persons who experience the same event or series of events in a particular period. For example all persons born in a particular year or all couples married in a particular year are considered cohorts of that year.

**De Facto and De Jure Counts** - In a census the enumeration is affected by the type of population count to be obtained. The census may be designed to count persons where they are found on census day (a de facto count) or according to their usual place of residence (a de jure count). The U.S. Census is a de jure count. Only transients who have no usual place of residence are counted on a de facto basis.

**Dependency Ratio** - the proportion of the population dependent on the adult population. For youth dependent the under 18 population is divided by the age group between 18 and 65. For elderly dependent the population over 64 is divided by the age group between 18 and 65.

**Error of Closure** - The difference between an estimates series and a decennial census. Error of closure can be the product of small cumulative error in an estimates series over a decade or it may result from differential accuracy of two decennial censuses.

**Fertility** - the childbearing performance of individuals, couples, groups or populations. Sometimes measured as the number of live births per 100 people in a given year or as the number of children born to women of a particular child bearing age.

**Gross Migration** - the sum of the in-migration and out-migration for a geographic area over time. Gross migration is a measure of the total movement or turnover of population. Gross migration is of most interest to persons needing information on population turnover rather than overall gain or loss, such as the real estate and transportation industries.

**Group Quarters** - living quarters shared by ten or more unrelated persons.

**Household** - a housing unit occupied by a family or fewer than 10 unrelated individuals.

**In-migrant** - a person who enters an area from some point outside the area for the purpose of establishing a permanent residence. The person may come from another nation, state, or county.

**Median Age** - the age which divides a population into two numerically equal groups; that is, the mid-point, half the people are younger than this age and half are older.

**Migration** - the movement of people across a specified boundary to establish a new permanent residence. Movement between countries, states or counties is considered migration. Movement within a county is considered "local movement".

**Mortality** - death as a component of population change. Usually measured as the number of deaths per 1,000 people in a given year.

**Natural Increase** - the difference between the number of births and the number of deaths in a given period, usually a year.

**Net-migration** - the difference between in-migration and out-migration. It is called net in-migration if there are more persons moving into the area than out. It is called net out-migration if there are more persons leaving the area than coming in.

**Out-migrant** - a person who leaves an area for some point outside the area for the purpose of establishing a permanent residence. The person may go to another nation, state, or country.

**Place** - a Census Designated Place (CDP), incorporated city, borough or Alaska Native Village Statistical Area (ANVSA).

**Population Estimate** - a computation of the probable population of a geographic area for a particular time. An estimate is usually done for a past time period for which indicator data already exists.

**Population Projection** - a computed future population number based on methodology which trends known historical data.

**Resident** - a person who lives in Alaska at least six months of the year and/or has no other usual place of residence elsewhere.

**Sex Ratio** - the number of males per 100 females.

**Urban Place** - a place with population of 2,500 or more. Places with less than 2,500 persons are considered rural.
